1 Overview

Main Features

- Single channel isolated IGBT Driver
- For 600V/1200V IGBTs
- 2A rail-to-rail output
- Vcesat-detection
- Active Miller Clamp
- Two level turn off

Product Highlights

- Coreless transformer isolated driver
- Basic insulation according to DIN EN 60747-5-2
- Basic insulation recognized under UL1577
- Integrated protection features
- Suitable for operation at high ambient temperature
- Automotive Qualified

Typical Application

- Drive inverters for HEV and EV
- Auxilliary inverters for HEV and EV
- High Power DC/DC inverters

Description

The 1ED020I12FTA is a galvanic isolated single channel IGBT driver in PG-DSO-20 package that provides an output current capability of typically 2A.

All logic pins are 5V CMOS compatible and could be directly connected to a microcontroller.

The data transfer across galvanic isolation is realized by the integrated Coreless Transformer Technology.

The 1ED020I12FTA provides several protection features like IGBT two level turn off, desaturation protection, active Miller clamping and active shut down.

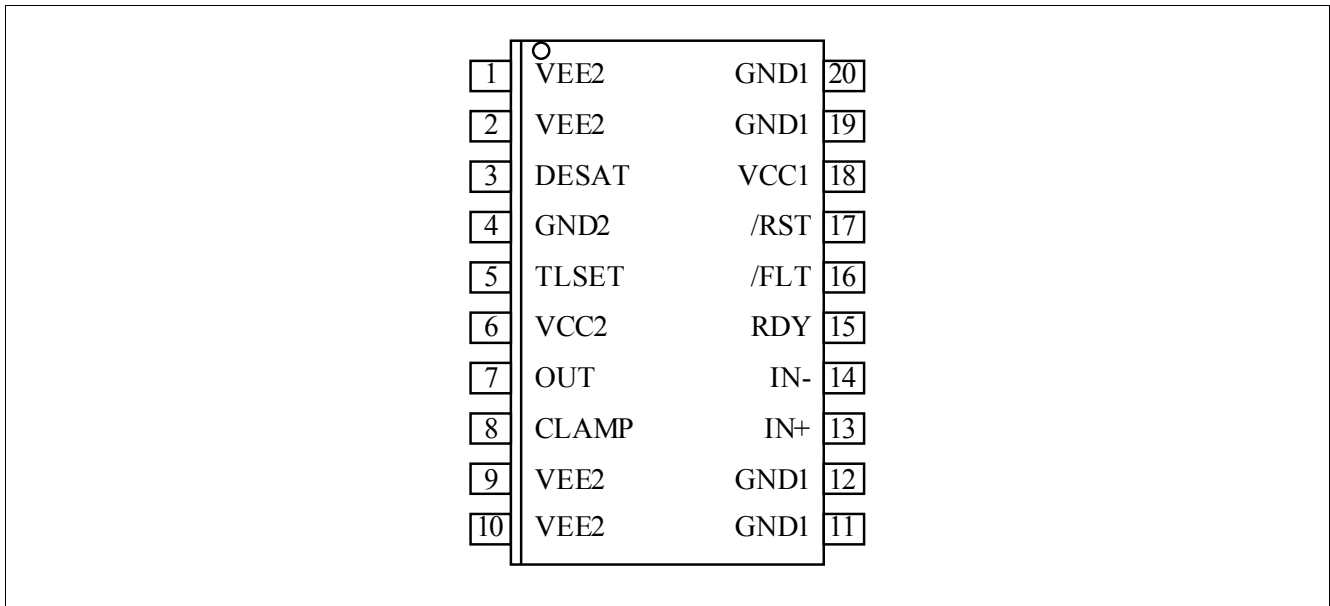

Figure 3 Pin Configuration PG-DSO-20 (top view)

3.2 Pin Functionality

GND1

Ground connection of the input side.

IN+ Non Inverting Driver Input

IN+ control signal for the driver output if IN- is set to low. (The IGBT is on if IN+ = high and IN- = low)

A minimum pulse width is defined to make the IC robust against glitches at IN+. An internal Pull-Down-Resistor ensures IGBT Off-State.

IN- Inverting Driver Input

IN- control signal for driver output if IN+ is set to high. (IGBT is on if IN- = low and IN+ = high)

A minimum pulse width is defined to make the IC robust against glitches at IN-. An internal Pull-Up-Resistor ensures IGBT Off-State.

/RST Reset Input

Function 1: Enable/shutdown of the input chip. (The IGBT is off if /RST = low). A minimum pulse width is defined to make the IC robust against glitches at /RST.

Function 2: Resets the DESAT-FAULT-state of the chip if /RST is low for a time T_{RST} . An internal Pull-Up-Resistor is used to ensure /FLT status output.

/FLT Fault Output

Open-drain output to report a desaturation error of the IGBT (FLT is low if desaturation occurs)

RDY Ready Status

Open-drain output to report the correct operation of the device (RDY = high if both chips are above the UVLO level and the internal chip transmission is faultless).

VCC1

5 V power supply of the input chip

VEE2

Negative power supply pins of the output chip. If no negative supply voltage is available, all VEE2 pins have to be connected to GND2.

DESAT Desaturation Detection Input

Monitoring of the IGBT saturation voltage (V_{CE}) to detect desaturation caused by short circuits. If OUT is high, V_{CE} is above a defined value and a certain blanking time has expired, the desaturation protection is activated and the IGBT is switched off. The blanking time is adjustable by an external capacitor.

CLAMP Miller Clamping

Ties the gate voltage to ground after the IGBT has been switched off at a defined voltage to avoid a parasitic switch-on of the IGBT. During turn-off, the gate voltage is monitored and the clamp output is activated when the gate voltage goes below 2 V below VEE2.

GND2 Reference Ground

Reference ground of the output chip.

OUT Driver Output

Output pin to drive an IGBT. The voltage is switched between VEE2 and VCC2. In normal operating mode Vout is controlled by IN+, IN- and /RST. During error mode (UVLO, internal error or DESAT) Vout is set to VEE2 independent of the input control signals.

VCC2

Positive power supply pin of the output side.

TLSET Two Level Turn Off Adjust

Circuitry at TLSET adjust the two level turn off time with an external capacitor to GND2 and the two level voltage with an external Zener diode to GND2, for wave forms please see [Figure 9](#).

4 Functional Description

4.1 Introduction

The 1ED020I12FTA is an advanced IGBT gate driver for motor drives typical greater 10 kW. Control and protection functions are included to make possible the design of high reliability systems.

The device consists of two galvanic separated parts. The input chip can be directly connected to a standard 5 V DSP or microcontroller with CMOS in/output and the output chip is connected to the high voltage side.

An effective active Miller clamp function avoids the need of negative gate driving in some applications and allows the use of a simple bootstrap supply for the high side driver.

A rail-to-rail driver output enables the user to provide easy clamping of the IGBTs gate voltage during short circuit of the IGBT. So an increase of short circuit current due to the feedback via the Miller capacitance can be avoided. Further, a rail-to-rail output reduces power dissipation.

The device also includes an IGBT desaturation protection with a FAULT status output.

A two-level turn-off feature with adjustable delay protects against excessive overvoltage at turn-off in case of overcurrent or short circuit condition. The same delay is applied at turn-on to prevent pulse width distortion.

A READY status output reports if the device is supplied and operates correctly.

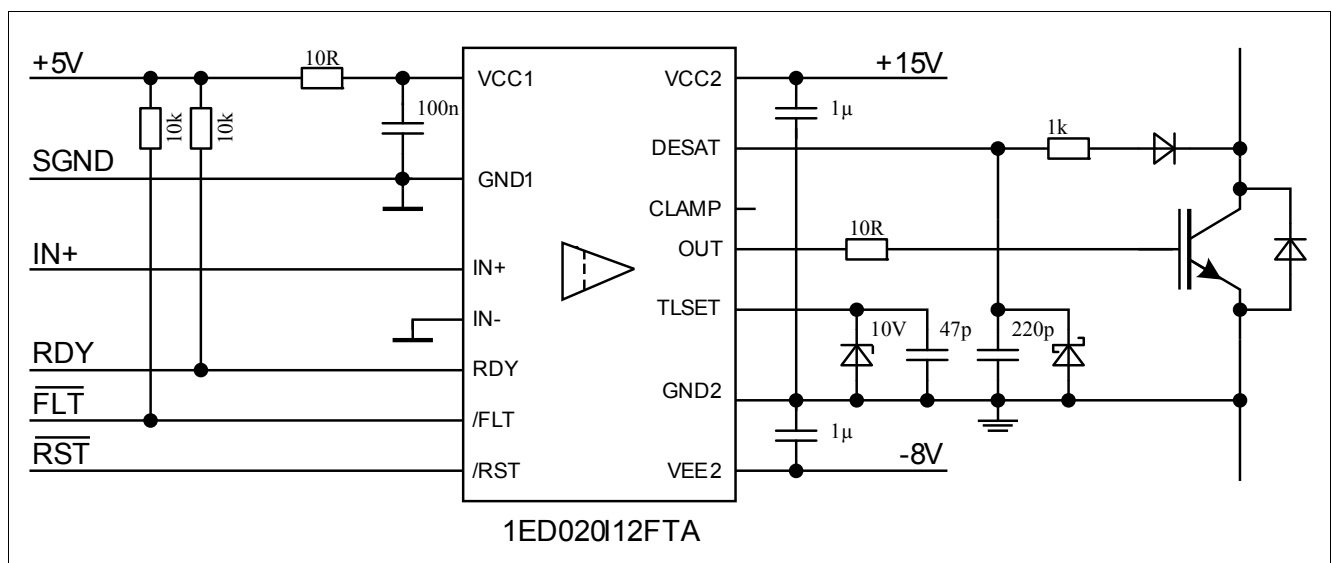

Figure 4 Application Example Bipolar Supply

4.2 Supply

The driver 1ED020I12FTA is designed to support two different supply configurations, bipolar supply and unipolar supply.

In bipolar supply the driver is typically supplied with a positive voltage of 15V at VCC2 and a negative voltage of -8V at VEE2, refer to [Figure 4](#). Negative supply prevents a dynamic turn on due to the additional charge which is generated from IGBT input capacitance times negative supply voltage. If an appropriate negative supply voltage is used, connecting CLAMPxx to IGBT gate is redundant and therefore typically not necessary.

For unipolar supply configuration the driver is typically supplied with a positive voltage of 15V at VCC2. Erratically dynamic turn on of the IGBT could be prevented with active Miller clamp function, so CLAMP output is directly connected to IGBT gate, refer to [Figure 5](#).

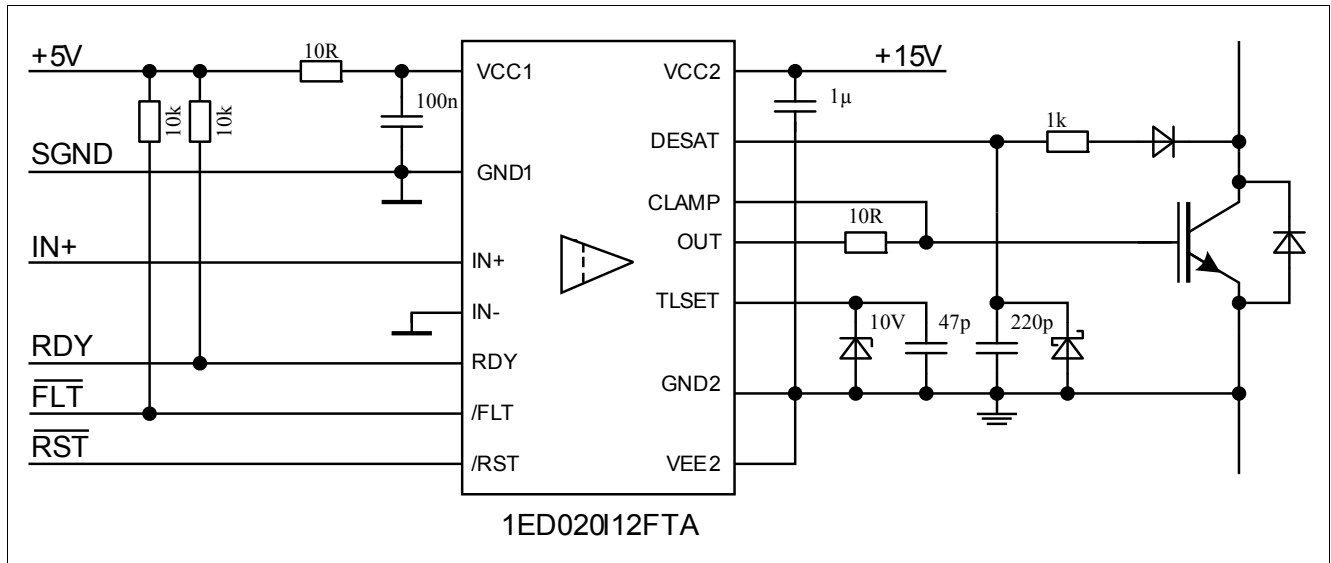

Figure 5 Application Example Unipolar Supply

4.3 Internal Protection Features

4.3.1 Undervoltage Lockout (UVLO)

To ensure correct switching of IGBTs the device is equipped with an undervoltage lockout for both chips, refer to [Figure 13](#) and [Figure 14](#).

If the power supply voltage V_{VCC1} of the input chip drops below V_{UVLOL1} a turn-off signal is sent to the output chip before power-down. The IGBT is switched off and the signals at IN+ and IN- are ignored as long as V_{VCC1} reaches the power-up voltage V_{UVLOH1} .

If the power supply voltage V_{VCC2} of the output chip goes down below V_{UVLOL2} the IGBT is switched off and signals from the input chip are ignored as long as V_{VCC2} reaches the power-up voltage V_{UVLOH2} . VEE2 is not monitored, otherwise negative supply voltage range from 0 V to -12 V would not be possible.

4.3.2 READY Status Output

The READY output at pin /RDY shows the status of three internal protection features.

- UVLO of the input chip
- UVLO of the output chip after a short delay
- Internal signal transmission after a short delay

It is not necessary to reset the READY signal since its state only depends on the status of the former mentioned protection signals.

4.3.3 Watchdog Timer

During normal operation the internal signal transmission is monitored by a watchdog timer. If the transmission fails for a given time, the IGBT is switched off and the READY output reports an internal error.

4.3.4 Active Shut-Down

The Active Shut-Down feature ensures a safe IGBT off-state if the output chip is not connected to the power supply, IGBT gate is clamped at OUT to VEE2.

4.4 Non-Inverting and Inverting Inputs

There are two possible input modes to control the IGBT. At non-inverting mode IN+ controls the driver output while IN- is set to low. At inverting mode IN- controls the driver output while IN+ is set to high, refer to [Figure 7](#). A minimum input pulse width is defined to filter occasional glitches.

4.5 Driver Output

The output driver section uses only MOSFETs to provide a rail-to-rail output. This feature permits that tight control of gate voltage during on-state and short circuit can be maintained as long as the drivers supply is stable. Due to the low internal voltage drop, switching behaviour of the IGBT is predominantly governed by the gate resistor. Furthermore, it reduces the power to be dissipated by the driver.

4.6 Two-Level Turn-Off

The Two-Level Turn-OFF introduces a second turn off voltage level at the driver output in between ON- and OFF-level, refer to [Figure 8](#). This additional level ensures lower V_{CE} overshoots at turn off by reducing gate emitter voltage of the IGBT at short circuits or over current events. The V_{GE} level is adjusting the current of the IGBT at the end two level turn off interval, the required timing is depending on stray inductance and over current at beginning of two level turn off interval.

Reference voltage level and hold up time could be adjusted at TLSET pin. The reference voltage is set by the required Zener diode connected between pin TLSET and GND2. The holdup time is set by the capacitor connected to the same pin TLSET and GND2.

The hold time can be adjusted during switch on using the whole capacitance connected at pin TLSET including capacitor, parasitic wiring capacitance and junction capacitance of Zener diode. When a switch on signal is given the IC starts to discharge C_{TLSET} . Discharging C_{TLSET} is stopped after 500 ns. Then C_{TLSET} is charged with an internal charge current I_{TLSET} . When the voltage of the capacitor C_{TLSET} exceeds 7 V a second current source starts charging C_{TLSET} up to V_{ZDIODE} . At the end of this discharge-charge cycle the gate driver is switched on.

The time between IN initiated switch-on signal (minus an internal propagation delay of approximately 200 ns) and switch-on of the gate drive is sampled and stored digitally. It represents the two level turn off set time T_{TLSET} during switch-off. Due to digitalization the t_{pdon} time can vary in time steps of 50 ns.

If switch off is initiated from IN+, IN- or /RST signal, the gate driver is switched off immediately after internal propagation delay of approximately 200 ns and V_{OUT} begins to decrease to the second gate voltage level.

For switch off initiated by DESAT, the gate driver switch off is delayed by desaturation sense to OUT delay, afterwards V_{OUT} begins to decrease to the second gate voltage level.

For reaching second gate voltage level the output voltage V_{OUT} is sensed and compared with the Zener voltage V_{ZDIODE} . When V_{OUT} falls below the reference voltage V_{ZDIODE} of the Zener diode the switch off process is interrupted and V_{OUT} is adjusted to V_{ZDIODE} . OUT is switched to VEE2 after the holdup time has passed.

The Two-Level Turn-OFF function cannot be disabled.

4.7 Minimal On Time / Off Time

The 1ED020I12FTA driver requires minimal on and off time for proper operation in the application. Minimal on time must be greater than the adjustable two level plateau time T_{TLSET} , shorter on times will be suppressed by generating of the plateau time refer to [Figure 10](#). Due to the short on time, the voltage at TLSET pin does not reach the comparator threshold; therefore the driver does not turn on. A similar principle takes place for off time. Minimal off time must be greater than T_{TLSET} ; shorter off times will be suppressed, which means OUT stays on refer to [Figure 11](#). A two level turn off plateau cannot be shortened by the driver. If the driver has entered the turn off sequence it cannot switch off due to the fact, that the driver has already entered the shut off mode. But if the driver input signal is turned on again, it will leave the lower level after T_{TLSET} time by switching OUT to high, refer to [Figure 12](#).

4.8 External Protection Features

4.8.1 Desaturation Protection

A desaturation protection ensures the protection of the IGBT at short circuit. When the DESAT voltage goes up and reaches 9 V, the output is driven low, refer to [Figure 9](#). Further, the FAULT output is activated. A programmable blanking time is used to allow enough time for IGBT saturation. Blanking time is provided by a highly precise internal current source and an external capacitor.

4.8.2 Active Miller Clamp

In a half bridge configuration the switched off IGBT tends to dynamically turn on during turn on phase of the opposite IGBT. A Miller clamp allows sinking the Miller current across a low impedance path in this high dV/dt situation. Therefore in many applications, the use of a negative supply voltage can be avoided.

During turn-off, the gate voltage is monitored and the clamp output is activated when the gate voltage goes below typical 2 V (related to VEE2). The clamp is designed for a Miller current up to 2 A.

4.8.3 Short Circuit Clamping

During short circuit the IGBTs gate voltage tends to rise because of the feedback via the Miller capacitance. An additional protection circuit connected to OUT and CLAMP limits this voltage to a value slightly higher than the supply voltage. A current of maximum 500 mA for 10 μ s may be fed back to the supply through one of this paths. If higher currents are expected or a tighter clamping is desired external Schottky diodes may be added.

4.9 RESET

The reset input has two functions.

Firstly, /RST is in charge of setting back the FAULT output. If /RST is low longer than a given time, /FLT will be cleared at the rising edge of /RST, refer to [Figure 9](#); otherwise, it will remain unchanged. Moreover, it works as enable/shutdown of the input logic, refer to [Figure 7](#).

5 Electrical Parameters

5.1 Absolute Maximum Ratings

Note: Absolute maximum ratings are defined as ratings, which when being exceeded may lead to destruction of the integrated circuit. Unless otherwise noted all parameters refer to GND1.

Table 2 Absolute Maximum Ratings

Parameter	Symbol	Values		Unit	Note / Test Condition
		Min.	Max.		
Positive power supply output side	V_{VCC2}	-0.3	20	V	1)
Negative power supply output side	V_{VEE2}	-12	0.3	V	1)
Maximum power supply voltage output side ($V_{VCC2} - V_{VEE2}$)	V_{max2}	–	28	V	–
Gate driver output	V_{OUT}	$V_{VEE2}-0.3$	$V_{max2}+0.3$	V	–
Gate driver high output maximum current	I_{OUT}	–	2.4	A	$t = 2 \mu s$
Gate & Clamp driver low output maximum current	I_{OUT}	–	2.4	A	$t = 2 \mu s$
Maximum short circuit clamping time	t_{CLP}	–	10	μs	$I_{CLAMP/OUT} = 500 \text{ mA}$
Positive power supply input side	V_{VCC1}	-0.3	6.5	V	–
Logic input voltages (IN+, IN-, \overline{RST})	$V_{LogicIN}$	-0.3	6.5	V	–
Open-drain Logic output voltage (\overline{FLT})	$V_{FLT\#}$	-0.3	6.5	V	–
Open-drain Logic output voltage (RDY)	V_{RDY}	-0.3	6.5	V	–
Open-drain Logic output current (\overline{FLT})	$I_{FLT\#}$	–	10	mA	–
Open-drain Logic output current (RDY)	I_{RDY}	–	10	mA	–
Pin DESAT voltage	V_{DESAT}	-0.3	$V_{VCC2} + 0.3$	V	1)
Pin CLAMP voltage	V_{CLAMP}	-0.3	$V_{VCC2} + 0.3^{2)}$	V	3)
Junction temperature	T_J	-40	150	°C	–
Storage temperature	T_S	-55	150	°C	–
Power dissipation, per input part	$P_{D, IN}$	–	100	mW	4) @ $T_A = 25^\circ C$
Power dissipation, per output part	$P_{D, OUT}$	–	700	mW	4) @ $T_A = 25^\circ C$
Thermal resistance (Input part)	$R_{THJA, IN}$	–	139	K/W	4) @ $T_A = 25^\circ C$
Thermal resistance (Output chip active)	$R_{THJA, OUT}$	–	117	K/W	4) @ $T_A = 25^\circ C$
ESD Capability	V_{ESD}	–	1.5	kV	Human Body Model ⁵⁾

1) With respect to GND2.

2) May be exceeded during short circuit clamping.

3) With respect to VEE2.

Electrical Parameters/Operating Parameters

- 4) Output IC power dissipation is derated linearly at 8.5 mW/°C above 68°C. Input IC power dissipation does not require derating. See **Figure 17** for reference layouts for these thermal data. Thermal performance may change significantly with layout and heat dissipation of components in close proximity.
- 5) According to EIA/JESD22-A114-B (discharging a 100 pF capacitor through a 1.5 kΩ series resistor).

5.2 Operating Parameters

Note: Within the operating range the IC operates as described in the functional description. Unless otherwise noted all parameters refer to GND1.

Table 3 Operating Parameters

Parameter	Symbol	Values		Unit	Note / Test Condition
		Min.	Max.		
Positive power supply output side	V_{VCC2}	13	20	V	1)
Negative power supply output side	V_{VEE2}	-12	0	V	1)
Maximum power supply voltage output side ($V_{VCC2} - V_{VEE2}$)	V_{max2}	–	28	V	–
Positive power supply input side	V_{VCC1}	4.5	5.5	V	–
Logic input voltages (IN+, IN-, RST)	$V_{LogicIN}$	-0.3	5.5	V	–
Pin CLAMP voltage	V_{CLAMP}	$V_{VEE2}-0.3$	$V_{VCC2}^{2)}$	V	–
Pin DESAT voltage	V_{DESAT}	-0.3	V_{VCC2}	V	1)
Pin TLSET voltage	V_{TLSET}	-0.3	V_{VCC2}	V	1)
Ambient temperature	T_A	-40	125	°C	–
Common mode transient immunity ³⁾	$ dV_{ISO}/dt $	–	50	kV/μs	@ 500 V

1) With respect to GND2.

2) May be exceeded during short circuit clamping.

3) The parameter is not subject to production test - verified by design/characterization

5.3 Recommended Operating Parameters

Note: Unless otherwise noted all parameters refer to GND1.

Table 4 Recommended Operating Parameters

Parameter	Symbol	Value	Unit	Note / Test Condition
Positive power supply output side	V_{VCC2}	15	V	1)
Negative power supply output side	V_{VEE2}	-8	V	1)
Positive power supply input side	V_{VCC1}	5	V	–

1) With respect to GND2.

5.4 Electrical Characteristics

Note: The electrical characteristics include the spread of values in supply voltages, load and junction temperatures given below. Typical values represent the median values at $T_A = 25^\circ\text{C}$. Unless otherwise noted all voltages are given with respect to their respective GND (GND1 for pins 11 to 20, GND2 for pins 1 to 10).

5.4.1 Voltage Supply

Table 5 Voltage Supply

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
UVLO Threshold Input Chip	V_{UVLOH1}	–	4.1	4.3	V	–

5.4.3 Gate Driver

Table 7 Gate Driver

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
High Level Output Voltage	V_{OUTH1}	$V_{\text{VCC2}}-1.2$	$V_{\text{VCC2}}-0.8$	–	V	$I_{\text{OUTH}} = -20 \text{ mA}$
	V_{OUTH2}	$V_{\text{VCC2}}-2.5$	$V_{\text{VCC2}}-2.0$	–	V	$I_{\text{OUTH}} = -200 \text{ mA}$
	V_{OUTH3}	$V_{\text{VCC2}}-9$	$V_{\text{VCC2}}-5$	–	V	$I_{\text{OUTH}} = -1 \text{ A}$
	V_{OUTH4}	–	$V_{\text{VCC2}}-10$	–	V	$I_{\text{OUTH}} = -2 \text{ A}$
High Level Output Peak Current	I_{OUTH}	-1.5	-2.0	–	A	IN+ = High, IN- = Low; OUT = High
Low Level Output Voltage	V_{OUTL1}	–	$V_{\text{VEE2}}+0.04$	$V_{\text{VEE2}}+0.09$	V	$I_{\text{OUTL}} = 20 \text{ mA}$
	V_{OUTL2}	–	$V_{\text{VEE2}}+0.3$	$V_{\text{VEE2}}+0.85$	V	$I_{\text{OUTL}} = 200 \text{ mA}$
	V_{OUTL3}	–	$V_{\text{VEE2}}+2.1$	$V_{\text{VEE2}}+5.0$	V	$I_{\text{OUTL}} = 1 \text{ A}$
	V_{OUTL4}	–	$V_{\text{VEE2}}+7$	–	V	$I_{\text{OUTL}} = 2 \text{ A}$
Low Level Output Peak Current	I_{OUTL}	1.5	2.0	–	A	IN+ = Low, IN- = Low; OUT = Low, $V_{\text{VCC2}} = 15 \text{ V}$, $V_{\text{VEE2}} = -8 \text{ V}$

5.4.4 Active Miller Clamp

Table 8 Active Miller Clamp

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Low Level Clamp Voltage	V_{CLAMPL1}	–	$V_{\text{VEE2}}+0.03$	$V_{\text{VEE2}} +0.08$	V	$I_{\text{OUTL}} = 20 \text{ mA}$
	V_{CLAMPL2}	–	$V_{\text{VEE2}}+0.3$	$V_{\text{VEE2}} +0.8$	V	$I_{\text{OUTL}} = 200 \text{ mA}$
	V_{CLAMPL3}	–	$V_{\text{VEE2}}+1.9$	$V_{\text{VEE2}} +4.8$	V	$I_{\text{OUTL}} = 1 \text{ A}$
Low Level Clamp Current	I_{CLAMPL}	2	–	–	A	1)
Clamp Threshold Voltage	V_{CLAMP}	1.6	2.1	2.4	V	Related to VEE2

1) The parameter is not subject to production test - verified by design/characterization

5.4.5 Short Circuit Clamping

Table 9 Short Circuit Clamping

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Clamping voltage (OUT) ($V_{OUT} - V_{VCC2}$)	V_{CLPout}	–	0.8	1.3	V	IN+ = High, IN- = Low, OUT = High $I_{OUT} = 500$ mA (pulse test, $t_{CLPmax} = 10$ μ s)
Clamping voltage (CLAMP) ($V_{VCLAMP} - V_{VCC2}$)	$V_{CLPclamp}$	–	1.3	–	V	IN+ = High, IN- = Low, OUT = High $I_{CLAMP} = 500$ mA (pulse test, $t_{CLPmax} = 10$ μ s)
Clamping voltage (CLAMP)	$V_{CLPclamp}$	–	0.7	1.1	V	IN+ = High, IN- = Low, OUT = High $I_{CLAMP} = 20$ mA

5.4.6 Dynamic Characteristics

Dynamic characteristics are measured with $V_{VCC1} = 5$ V, $V_{VCC2} = 15$ V and $V_{VEE2} = -8$ V.

Table 10 Dynamic Characteristics

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
IN+, IN- Input to output propagation delay ON and OFF	T_{PDON}	1.5	1.75	2.0	μ s	$C_{TLSET} = 0$ pF, $C_{LOAD} = 100$ pF, $T_A = 25^\circ$ C
N+, IN- Input to output propagation delay distortion ($T_{PDOFF} - T_{PDON}$)	T_{PDISTO}	-50	0	50	ns	$C_{TLSET} = 0$ pF, $C_{LOAD} = 100$ pF, $T_A = 25^\circ$ C
N+, IN- Input to output propagation delay ON and OFF	T_{PDONt}	1.5	1.9	2.3	μ s	$C_{TLSET} = 0$ pF, $C_{LOAD} = 100$ pF, $T_A = 125^\circ$ C
N+, IN- Input to output propagation delay distortion ($T_{PDOFF} - T_{PDON}$)	$T_{PDISTot}$	-20	45	70	ns	$C_{TLSET} = 0$ pF, $C_{LOAD} = 100$ pF, $T_A = 125^\circ$ C
IN+, IN- Input to output propagation delay ON and OFF	T_{PDONt}	1.45	1.75	2.05	μ s	$C_{TLSET} = 0$ pF, $C_{LOAD} = 100$ pF, $T_A = -40^\circ$ C
IN+ Input to output propagation delay distortion ($T_{PDOFF} - T_{PDON}$)	$T_{PDISTot}$	-60	-5	50	ns	$C_{TLSET} = 0$ pF, $C_{LOAD} = 100$ pF, $T_A = -40^\circ$ C

Table 10 Dynamic Characteristics (cont'd)

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Rise Time	T_{RISE}	10	30	60	ns	$C_{LOAD} = 1 \text{ nF}$, $V_L 10\%$, $V_H 90\%$
		150	400	800	ns	$C_{LOAD} = 34 \text{ nF}$ $V_L 10\%$, $V_H 90\%$
Fall Time	T_{FALL}	10	20	40	ns	$C_{LOAD} = 1 \text{ nF}$ $V_L 10\%$, $V_H 90\%$
		100	250	500	ns	$C_{LOAD} = 34 \text{ nF}$ $V_L 10\%$, $V_H 90\%$

5.4.7 Desaturation Protection

Table 11 Desaturation Protection

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Blanking Capacitor Charge Current	I_{DESATC}	450	500	550	μA	$V_{VCC2} = 15 \text{ V}$, $V_{VEE2} = -8 \text{ V}$ $V_{DESAT} = 2 \text{ V}$
Blanking Capacitor Discharge Current	I_{DESATD}	11	15	–	mA	$V_{VCC2} = 15 \text{ V}$, $V_{VEE2} = -8 \text{ V}$ $V_{DESAT} = 6 \text{ V}$
Desaturation Reference Level	V_{DESAT}	8.5	9	9.5	V	$V_{VCC2} = 15 \text{ V}$
Desaturation Sense to OUT TLTO	$T_{DESATOUT}$	–	250	320	ns	$V_{OUT} = 90\%$ $C_{LOAD} = 1 \text{ nF}$
Desaturation Sense to FLT Low Delay	$T_{DESATFLT}$	–	–	2.25	μs	$V_{FLT\#} = 10\%$; $I_{FLT\#} = 5 \text{ mA}$
Desaturation Low Voltage	V_{DESATL}	40	70	110	mV	IN+=Low, IN-=Low, OUT=Low

5.4.8 Active Shut Down

Table 12 Active Shut Down

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Active Shut Down Voltage	$V_{ACTSD}^{1)}$	–	–	2.0	V	$I_{OUT} = -200$ mA, V_{CC2} open

1) With reference to VEE2

5.4.9 Two-level Turn-off

Table 13 Two-level Turn-off

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
External reference voltage range (Zener-Diode)	V_{ZDIODE}	7.5	–	$V_{CC2}-0.5$	V	–
Reference Voltage for setting two-level delay time	V_{TLSET}	6.6	7	7.3	V	–
Current for setting two-level delay time and external reference voltage (Zener-Diode)	I_{TLSET}	420	500	550	μA	$V_{TLSET} = 10$ V
External Capacitance Range	C_{TLSET}	0	–	220	pF	–

6 Insulation Characteristics

Insulation characteristics are guaranteed only within the safety maximum ratings which must be ensured by protective circuits in application. Surface mount classification is class A in accordance with CECC00802.

This coupler is suitable for “basic insulation” only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.

6.1 Certified according to DIN EN 60747-5-2 (VDE 0884 Teil 2): 2003-01. Basic Insulation

Table 14 Certified according to DIN EN 60747-5-2

Description	Symbol	Characteristic	Unit
Installation classification per EN 60664-1, Table 1 for rated mains voltage $\leq 150 V_{RMS}$ for rated mains voltage $\leq 300 V_{RMS}$ for rated mains voltage $\leq 600 V_{RMS}$		I-IV I-III I-II	–
Climatic Classification		40/125/21	–
Pollution Degree (EN 60664-1)		2	–
Minimum External Clearance	CLR	8	mm
Minimum External Creepage	CPG	8	mm
Minimum Comparative Tracking Index	CTI	175	–
Maximum Repetitive Insulation Voltage	V_{IORM}	1420	V_{PEAK}
Highest Allowable Overvoltage	V_{IOTM}	6000	V_{PEAK}
Maximum Surge Insulation Voltage	V_{IOSM}	6000	V

6.2 Recognized under UL 1577

Table 15 Recognized under UL 1577

Description	Symbol	Characteristic	Unit
Insulation Withstand Voltage / 1 min	V_{ISO}	3750	V_{rms}
Insulation Test Voltage / 1 s	V_{ISO}	4500	V_{rms}

9 Application Notes

9.1 Reference Layout for Thermal Data

The PCB layout shown in [Figure 17](#) represents the reference layout used for the thermal characterisation. Pins 11, 12, 19 and 20 (GND1) and pins 1, 2, 9 and 10 (VEE2) require ground plane connections for achieving maximum power dissipation. The 1ED020I12FTA is conceived to dissipate most of the heat generated through this pins.

Figure 17 Reference Layout for Thermal Data (Copper thickness 102 µm)

9.2 Printed Circuit Board Guidelines

Following factors should be taken into account for an optimum PCB layout.

- Sufficient spacing should be kept between high voltage isolated side and low voltage side circuits.
- The same minimum distance between two adjacent high-side isolated parts of the PCB should be maintained to increase the effective isolation and reduce parasitic coupling.
- In order to ensure low supply ripple and clean switching signals, bypass capacitor trace lengths should be kept as short as possible.
- Lowest trace length for VEE2 to GND2 decoupling could be achieved with capacitor closed to pins 2 and 4.
