

High-voltage, high-side current sense amplifier

Features

- Independent supply and input common-mode voltages
- Wide common-mode operating range:
2.9 to 70 V in single-supply configuration
-2.1 to 65 V in dual-supply configuration
- Wide common-mode surviving range:
-16 to 75 V (reversed battery and load-dump conditions)
- Supply voltage range:
2.7 to 5.5 V in single supply configuration
- Low current consumption: I_{CC} max = 360 μ A
- Pin selectable gain: 50 V/V or 100 V/V
- Buffered output
- EMI filtering

Applications

- Automotive current monitoring
- DC motor control
- Photovoltaic systems
- Battery chargers
- Precision current sources
- Current monitoring of notebook computers
- Uninterruptible power supplies
- High-end power supplies

Description

The TSC1031 measures a small differential voltage on a high-side shunt resistor and translates it into a ground-referenced output voltage. The TSC1031's dedicated schematic eases the implementation of EMI filtering in harsh environments. The gain is adjustable to 50 V/V or 100 V/V by a selection pin.

Wide input common-mode voltage range, low quiescent current, and tiny TSSOP8 packaging enable use in a wide variety of applications.

The input common-mode and power supply voltages are independent. The common-mode voltage can range from 2.9 to 70 V in the single-supply configuration or be offset by an adjustable voltage supplied on the Vcc- pin in the dual-supply configuration.

With a current consumption lower than 360 μ A and a virtually null input leakage current in standby mode, the power consumption in the applications is minimized.

Figure 2. Dual-supply configuration schematic

Figure 3. Common-mode versus supply voltage in dual-supply configuration

Table 1 describes the function of each pin. Their position is shown in the illustration on the cover page and in Figure 1 on page 3.

Table 1. Pin description

Symbol	Type	Function
Out	Analog output	The Out voltage is proportional to the magnitude of the sense voltage $V_p - V_m$.
Gnd	Power supply	Ground line.
Vcc+	Power supply	Positive power supply line.
Vcc-	Power supply	Negative power supply line.
Vp	Analog input	Connection for the external sense resistor. The measured current enters the shunt on the V_p side.
Vm	Analog input	Connection for the external sense resistor. The measured current exits the shunt on the V_m side.
SEL	Digital input	Gain-select pin.
A1	Analog output	Connection to the output resistor.

2 Absolute maximum ratings and operating conditions

Table 2. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{id}	Input pins differential voltage ($V_p - V_m$)	± 20	V
V_{in_sense}	Sensing pins input voltages (V_p, V_m) ⁽¹⁾	-16 to 75	V
V_{in_sel}	Gain selection pin input voltage (SEL) ⁽²⁾	-0.3 to $V_{CC+} + 0.3$	V
V_{in_A1}	A1 pin input voltage ⁽²⁾	-0.3 to $V_{CC+} + 0.3$	V
V_{CC+}	Positive supply voltage ⁽²⁾	-0.3 to 7	V
$V_{CC+} - V_{CC-}$	DC supply voltage	0 to 15	V
V_{out}	DC output pin voltage ⁽²⁾	-0.3 to $V_{CC+} + 0.3$	V
T_{stg}	Storage temperature	-55 to 150	°C
T_j	Maximum junction temperature	150	°C
R_{thja}	TSSOP8 thermal resistance junction to ambient	120	°C/W
	SO-8 thermal resistance junction to ambient	125	°C/W
ESD	HBM: human body model ⁽³⁾	2.5	kV
	MM: machine model ⁽⁴⁾	150	V
	CDM: charged device model ⁽⁵⁾	1.5	kV

1. These voltage values are measured with respect to the V_{CC-} pin.
2. These voltage values are measured with respect to the Gnd pin.
3. Human body model: a 100 pF capacitor is charged to the specified voltage, then discharged through a 1.5 kΩ resistor between two pins of the device. This is done for all couples of connected pin combinations while the other pins are floating.
4. Machine model: a 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω). This is done for all couples of connected pin combinations while the other pins are floating.
5. Charged device model: all pins plus package are charged together to the specified voltage and then discharged directly to ground.

Table 3. Operating conditions

Symbol	Parameter	Value	Unit
V_{CC+}	DC supply voltage in single-supply configuration from T_{min} to T_{max} (V_{CC-} connected to Gnd = 0 V)	2.7 to 5.5	V
V_{CC-}	Negative supply voltage in dual-supply configuration from T_{min} to T_{max}		
	$V_{CC+} = 5.5$ V max	-8 to 0	V
	$V_{CC+} = 3$ V max	-11 to 0	V
V_{icm}	Common-mode voltage range referred to pin Vcc - (T_{min} to T_{max})	2.9 to 70	V
T_{oper}	Operational temperature range (T_{min} to T_{max})	-40 to 125	°C

3 Electrical characteristics

The electrical characteristics given in the following tables are measured under the following test conditions unless otherwise specified.

- $T_{amb} = 25^{\circ}C$, $V_{CC+} = 5V$, V_{CC-} connected to Gnd (single-supply configuration).
- $V_{sense} = V_p - V_m = 50mV$, $V_m = 12V$, no load on Out, all gain configurations.
- Rf1, Rf2 and Rf3 resistors are short-circuited.

Table 4. Supply

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
I_{CC}	Total supply current	$V_{sense} = 0V$, $T_{min} < T_{amb} < T_{max}$		200	360	μA
I_{CC1}	Total supply current	$V_{sense} = 50mV$ $A_v = 50V/V$ $T_{min} < T_{amb} < T_{max}$		300	480	μA

Table 5. Input

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
DC CMR	DC common-mode rejection Variation of V_{out} versus V_{icm} referred to input ⁽¹⁾	$2.9V < V_m < 70V$, $T_{min} < T_{amb} < T_{max}$	90	105		dB
AC CMR	AC common-mode rejection Variation of V_{out} versus V_{icm} referred to input (peak-to-peak voltage variation)	$A_v = 50V/V$ or $100V/V$ $2.9V < V_{icm} < 30V$, 1 kHz sine wave		95		dB
SVR	Supply voltage rejection Variation of V_{out} versus V_{CC} ⁽²⁾	$A_v = 50V/V$, $2.7V < V_{CC} < 5.5V$ $V_{sense} = 30mV$, $T_{min} < T_{amb} < T_{max}$	85	100		dB
V_{os}	Input offset voltage ⁽³⁾	$T_{amb} = 25^{\circ}C$ $T_{min} < T_{amb} < T_{max}$			± 500 ± 1100	μV
dV_{os}/dT	Input offset drift vs. T	$A_v = 50V/V$ $T_{min} < T_{amb} < T_{max}$	-20		+5	$\mu V/^{\circ}C$
I_{lk}	Input leakage current	$V_{CC} = 0V$ $T_{min} < T_{amb} < T_{max}$			1	μA
I_{ib}	Input bias current	$V_{sense} = 0V$ $T_{min} < T_{amb} < T_{max}$		10	15	μA
Rg	Input resistor value	Valid for Rg1 and Rg2		5		k Ω
V_{IL}	Logic low voltage (SEL)	$V_{CCmin} < V_{CC} < V_{CCmax}$ $T_{min} < T_{amb} < T_{max}$	-0.3		0.5	V
V_{IH}	Logic high voltage (SEL)	$V_{CCmin} < V_{CC} < V_{CCmax}$ $T_{min} < T_{amb} < T_{max}$	1.2		V_{CC}	V
I_{sel}	Gain-select pins (SEL) leakage input current	SEL pin connected to GND or V_{CC} $T_{min} < T_{amb} < T_{max}$		400		nA

1. See [Chapter 5: Parameter definitions on page 13](#) for the definition of CMR.

2. See [Chapter 5](#) for the definition of SVR.

3. See [Chapter 5](#) for the definition of V_{os} .

Table 6. Output

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
K1	Sense amplifier gain ($K1 = Rg3/Rg1$)			10		
K2	Current multiplier gain	SEL= Gnd SEL= Vcc+		2.5 5		
Av	Total gain ($Av = 2.K1.K2$)	SEL= Gnd SEL= Vcc+		50 100		V/V
$\Delta V_{out}/\Delta T$	Output voltage drift vs. T ⁽¹⁾	Av = 50 V/V $T_{min} < T_{amb} < T_{max}$			±240	ppm/°C
$\Delta V_{out}/\Delta I_{out}$	Output stage load regulation	-10 mA < I _{out} < 10 mA I _{out} sink or source current Av = 50 V/V, T _{amb} = 25° C		0.3	±1.5	mV/mA
ΔV_{out}	Total output voltage accuracy ⁽²⁾	V _{sense} = 50 mV ⁽³⁾ T _{amb} = 25° C $T_{min} < T_{amb} < T_{max}$			±2.5 ±4	%
ΔV_{out}	Total output voltage accuracy	V _{sense} = 90 mV ⁽³⁾ T _{amb} = 25° C $T_{min} < T_{amb} < T_{max}$			±3.5 ±5	%
ΔV_{out}	Total output voltage accuracy	V _{sense} = 20 mV T _{amb} = 25° C $T_{min} < T_{amb} < T_{max}$			±3.5 ±5	%
ΔV_{out}	Total output voltage accuracy	V _{sense} = 10 mV T _{amb} = 25° C $T_{min} < T_{amb} < T_{max}$			±5.5 ±8	%
ΔV_{out}	Total output voltage accuracy	V _{sense} = 5 mV T _{amb} = 25° C $T_{min} < T_{amb} < T_{max}$			±10 ±22	%
I _{sc}	Short-circuit current	OUT connected to V _{CC} or GND	15	26		mA
V _{OH}	Output stage high-state saturation voltage V _{OH} = V _{CC} -V _{out}	V _{sense} = 1 V I _{out} = 1 mA		85	135	mV
V _{OL}	Output stage low-state saturation voltage	V _{sense} = -1 V I _{out} = 1 mA		80	125	mV

1. See [Chapter 5: Parameter definitions on page 13](#) for the definition of output voltage drift versus temperature.
2. The output voltage accuracy is the difference with the expected theoretical output voltage $V_{out-th} = Av \cdot V_{sense}$. See [Chapter 5](#) for a more detailed definition.
3. Except for Av = 100 V/V.

Table 7. Frequency response

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
ts	Output settling to 1% of final value	$V_{\text{sense}} = 10 \text{ mV to } 100 \text{ mV}$, $C_{\text{load}} = 47 \text{ pF}$				
		$A_v = 50 \text{ V/V}$		6		μs
		$A_v = 100 \text{ V/V}$		10		μs
t _{SEL}	Output settling to 1% of final value	Any change of state of SEL		1		μs
t _{rec}	Response to common-mode voltage change. Output settling to 1% of final value	$V_{\text{CC}+} = 5 \text{ V}$, $V_{\text{CC}-} = -5 \text{ V}$ V_m step change from -2 V to 30 V or 30 V to -2 V		20		μs
SR	Slew rate	$V_{\text{sense}} = 10 \text{ mV to } 100 \text{ mV}$	0.4	0.6		V/ μs
BW	3 dB bandwidth	$C_{\text{load}} = 47 \text{ pF}$ $V_{\text{icm}} = 12 \text{ V}$ $V_{\text{sense}} = 50 \text{ mV}$ $A_v = 50 \text{ V/V}$		700		kHz

5 Parameter definitions

5.1 Common mode rejection ratio (CMR)

The common mode rejection ratio (CMR) measures the ability of the current sensing amplifier to reject any DC voltage applied on both inputs V_p and V_m . The CMR is referred back to the input so that its effect can be compared with the applied differential signal. The CMR is defined by the formula:

$$\text{CMR} = -20 \cdot \log \frac{\Delta V_{\text{out}}}{\Delta V_{\text{icm}} \cdot A_v}$$

5.2 Supply voltage rejection ratio (SVR)

The supply voltage rejection ratio (SVR) measures the ability of the current-sensing amplifier to reject any variation of the supply voltage V_{CC} . The SVR is referred back to the input so that its effect can be compared with the applied differential signal. The SVR is defined by the formula:

$$\text{SVR} = -20 \cdot \log \frac{\Delta V_{\text{out}}}{\Delta V_{CC} \cdot A_v}$$

5.3 Gain (A_v) and input offset voltage (V_{os})

The input offset voltage is defined as the intersection between the linear regression of the V_{out} vs. V_{sense} curve with the X-axis (see [Figure 17](#)). If V_{out1} is the output voltage with $V_{\text{sense}} = V_{\text{sense1}}$ and V_{out2} is the output voltage with $V_{\text{sense}} = V_{\text{sense2}}$, then V_{os} can be calculated with the following formula.

$$V_{os} = V_{\text{sense1}} - \left(\frac{V_{\text{sense1}} - V_{\text{sense2}}}{V_{\text{out1}} - V_{\text{out2}}} \cdot V_{\text{out1}} \right)$$

Figure 17. V_{out} versus V_{sense} characteristics: detail for low V_{sense} values

The values of V_{sense1} and V_{sense2} used for the input offset calculations are detailed in [Table 9](#).

Table 9. Test conditions for V_{os} voltage calculation

A_v (V/V)	V_{sense1} (mV)	V_{sense2} (mV)
50	50	5
100	40	5

5.4 Output voltage drift versus temperature

The output voltage drift versus temperature is defined as the maximum variation of V_{out} with respect to its value at 25° C over the temperature range. It is calculated as follows:

$$\frac{\Delta V_{out}}{\Delta T} = \max \frac{V_{out}(T_{amb}) - V_{out}(25^{\circ}C)}{T_{amb} - 25^{\circ}C}$$

with $T_{min} < T_{amb} < T_{max}$.

Figure 18 provides a graphical definition of the output voltage drift versus temperature. On this chart V_{out} is always within the area defined by the maximum and minimum variation of V_{out} versus T , and $T = 25^{\circ}C$ is considered to be the reference.

Figure 18. Output voltage drift versus temperature ($A_v = 50 V/V$ $V_{sense} = 50 mV$)

5.5 Input offset drift versus temperature

The input voltage drift versus temperature is defined as the maximum variation of V_{os} with respect to its value at 25° C over the temperature range. It is calculated as follows:

$$\frac{\Delta V_{os}}{\Delta T} = \max \frac{V_{os}(T_{amb}) - V_{os}(25^\circ C)}{T_{amb} - 25^\circ C}$$

with $T_{min} < T_{amb} < T_{max}$.

Figure 19. provides a graphical definition of the input offset drift versus temperature. On this chart V_{os} is always comprised in the area defined by the maximum and minimum variation of V_{os} versus T, and $T = 25^\circ C$ is considered to be the reference.

Figure 19. Input offset drift versus temperature ($A_v = 50 V/V$)

5.6 Output voltage accuracy

The output voltage accuracy is the difference between the actual output voltage and the theoretical output voltage. Ideally, the current sensing output voltage should be equal to the input differential voltage multiplied by the theoretical gain, as in the following formula.

$$V_{out-th} = A_v \cdot V_{sense}$$

The actual value is very slightly different, mainly due to the effects of:

- the input offset voltage V_{os} ,
- the non-linearity.

Figure 20. Vout vs. Vsense theoretical and actual characteristics

The output voltage accuracy, expressed as a percentage, can be calculated with the following formula,

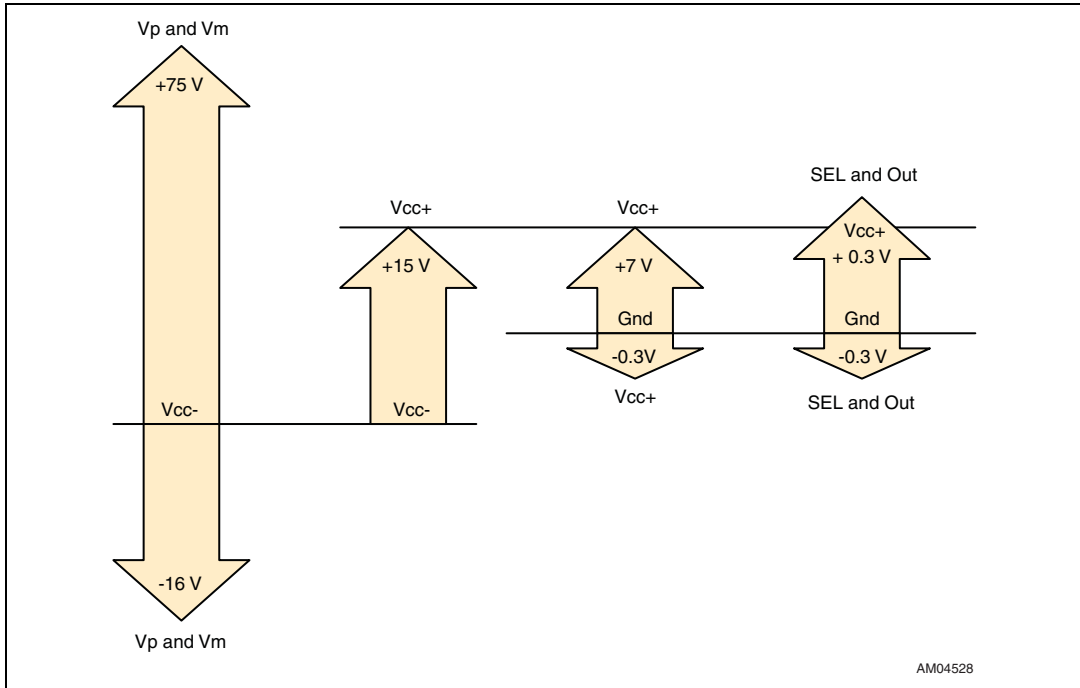

$$\Delta V_{\text{out}} = \frac{\text{abs}(V_{\text{out}} - (A_v \cdot V_{\text{sense}}))}{A_v \cdot V_{\text{sense}}}$$

with 50 V/V or 100 V/V depending on the configuration of the SEL pin.

6 Maximum permissible voltages on pins

The TSC1031 can be used in either single or dual supply configuration. The dual-supply configuration is achieved by disconnecting Vcc- and Gnd, and connecting Vcc- to a negative supply. *Figure 21* illustrates how the absolute maximum voltages on input pins Vp and Vm are referred to the Vcc- potential, while the maximum voltages on the positive supply pin, gain selection pins and output pins are referred to the Gnd pin. It should also be noted that the maximum voltage between Vcc- and Vcc+ is limited to 15 V.

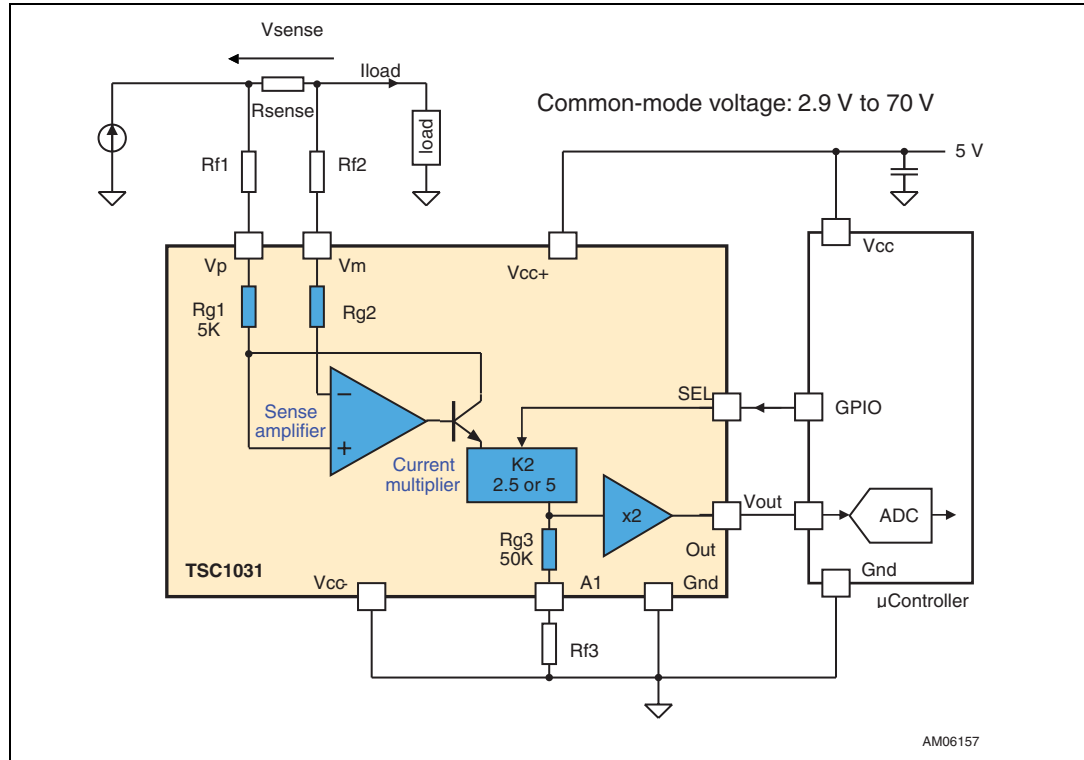

Figure 21. Maximum voltages on pins

7 Application information

The TSC1031 can be used to measure current and to feed back the information to a microcontroller.

Figure 22. Typical application

The current from the supply flows to the load through the R_{sense} resistor causing a voltage drop equal to V_{sense} across R_{sense} . The amplifier's input currents are negligible, therefore its inverting input voltage is equal to V_m . The amplifier's open-loop gain forces its non-inverting input to the same voltage as the inverting input. As a consequence, the amplifier adjusts current flowing through R_{g1} so that the voltage drop across R_{g1} exactly matches V_{sense} .

Therefore, the drop across R_{g1} is:

$$V_{R_{g1}} = V_{sense} = R_{sense} \cdot I_{load}$$

If $I_{R_{g1}}$ is the current flowing through R_{g1} , then $I_{R_{g1}}$ is given by the formula:

$$I_{R_{g1}} = V_{sense} / R_{g1}$$

The $I_{R_{g1}}$ current flows is multiplied by a ratio $K2$ and the resulting current flows into resistor R_{g3} . Therefore, the voltage drop on the R_{g3} resistor can be calculated as follows.

$$V_{R_{g3}} = R_{g3} \cdot K2 \cdot I_{R_{g1}} = (R_{g3} / R_{g1}) \cdot K2 \cdot V_{sense} = K1 \cdot K2 \cdot V_{sense} \text{ with } K1 = R_{g3} / R_{g1} = 10.$$

The voltage across the R_{g3} resistor is buffered to the Out pin by the voltage buffer, featuring a gain equal to 2. Therefore V_{out} can be expressed as:

$$V_{out} = 2 \cdot K1 \cdot K2 \cdot V_{sense} = A_v \cdot V_{sense} \text{ with } A_v = 2 \cdot K1 \cdot K2$$

or: $V_{out} = A_v \cdot R_{sense} \cdot I_{load}$

The current multiplier gain K2 can be set to 2.5 or 5 depending on the voltage applied on the SEL pin.

Since they define the full-scale output range of the application, the R_{sense} resistor and the amplification gain A_v are important parameters and must therefore be selected carefully.

The TSC1031's dedicated schematic eases the implementation of EMI filtering in harsh environments. A simple filter is described in [Figure 22](#), where the input filtering is performed by R_{f1} , R_{f2} and C_f .

The values of R_{f1} and R_{f2} should be equal so as to balance the contribution on both amplifier inputs. The value of the C_f capacitor should be selected so that the cut-off frequency of the first-order low-pass filter provides enough attenuation to the high frequency interferences.

To balance the contribution of R_{f1} and R_{f2} in the current sense amplifier gain, an output resistor R_{f3} should be connected between pin A1 and Gnd. The value of R_{f3} should be chosen according to the following formula.

$$K1 = 10 = R_{g3}/R_{g1} = R_{f3}/R_{f1} = R_{f3}/R_{f2}$$

If these precautions having been taken, the TSC1031's gain is unaffected by the implementation of the input filtering resistors.

8 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK[®] packages, depending on their level of environmental compliance. ECOPACK[®] specifications, grade definitions and product status are available at: www.st.com. ECOPACK[®] is an ST trademark.
