

# TPS70745, TPS70748, TPS70751, TPS70758, TPS70702 DUAL-OUTPUT LOW-DROPOUT VOLTAGE REGULATORS WITH POWER-UP SEQUENCING FOR SPLIT VOLTAGE DSP SYSTEMS

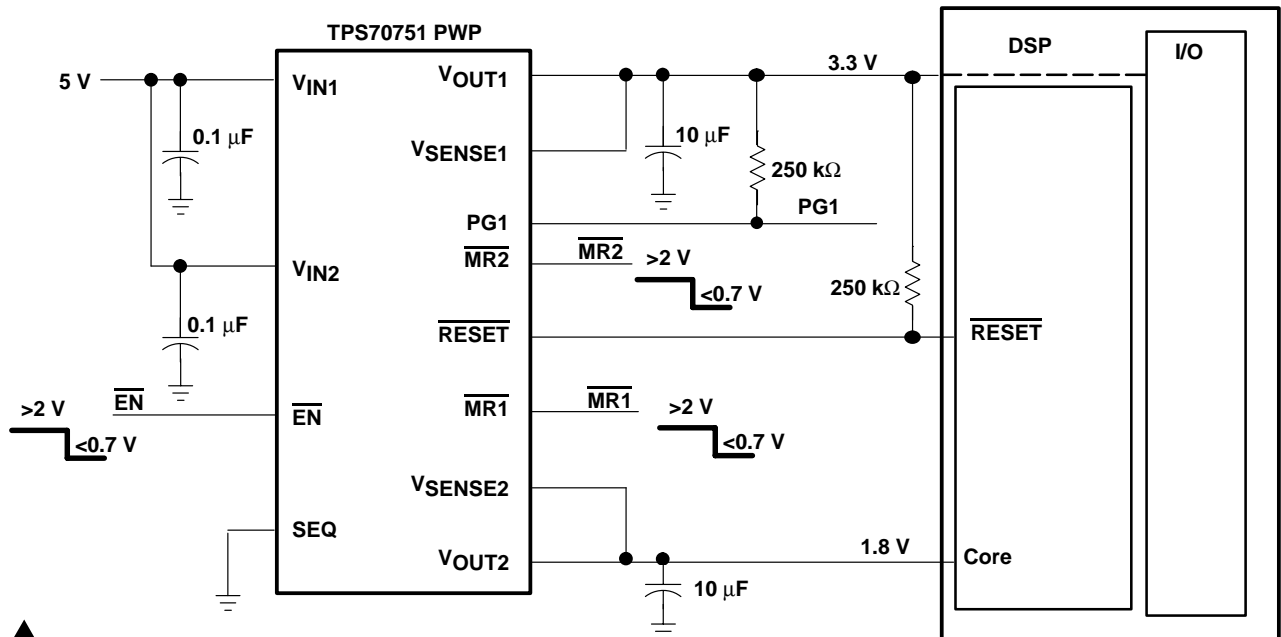

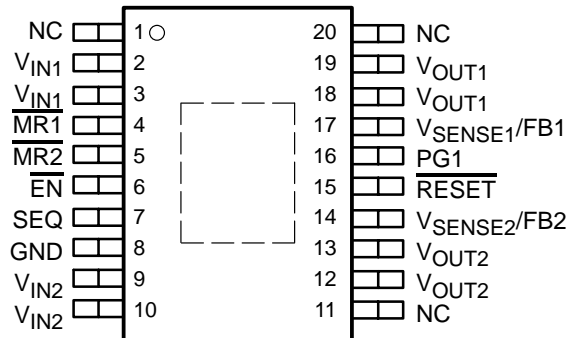

SLVS291B – MAY 2000 – REVISED OCTOBER 2002

- Dual Output Voltages for Split-Supply Applications
- Selectable Power-Up Sequencing for DSP Applications (See Part Number TPS708xx for Independently Enabled Outputs)
- Output Current Range of 250 mA on Regulator 1 and 125 mA on Regulator 2
- Fast Transient Response
- Voltage Options are 3.3-V/2.5-V, 3.3-V/1.8-V, 3.3-V/1.5-V, 3.3-V/1.2-V, and Dual Adjustable Outputs
- Open Drain Power-On Reset With 120-ms Delay
- Open Drain Power Good for Regulator 1
- Ultralow 190  $\mu\text{A}$  (typ) Quiescent Current
- 1  $\mu\text{A}$  Input Current During Standby
- Low Noise: 65  $\mu\text{V}_{\text{RMS}}$  Without Bypass Capacitor
- Quick Output Capacitor Discharge Feature
- Two Manual Reset Inputs
- 2% Accuracy Over Load and Temperature
- Undervoltage Lockout (UVLO) Feature
- 20-Pin PowerPAD™ TSSOP Package
- Thermal Shutdown Protection

## description

TPS707xx family devices are designed to provide a complete power management solution for TI DSP, processor power, ASIC, FPGA, and digital applications where dual output voltage regulators are required. Easy programmability of the sequencing function makes this family ideal for any TI DSP applications with power sequencing requirement. Differentiated features, such as accuracy, fast transient response, SVS supervisory circuit (power on reset), manual reset inputs, and enable function, provide a complete system solution.

SLVS291B – MAY 2000 – REVISED OCTOBER 2002

## description (continued)

The TPS707xx family of voltage regulators offers very low dropout voltage and dual outputs with power up sequence control, which is designed primarily for DSP applications. These devices have extremely low noise output performance without using any added filter bypass capacitors and are designed to have a fast transient response and be stable with 10  $\mu$ F low ESR capacitors.

These devices have fixed 3.3-V/2.5-V, 3.3-V/1.8-V, 3.3-V/1.5-V, 3.3-V/1.2-V, and adjustable/adjustable voltage options. Regulator 1 can support up to 250 mA and regulator 2 can support up to 125 mA. Separate voltage inputs allow the designer to configure the source power.

Because the PMOS device behaves as a low-value resistor, the dropout voltage is very low (typically 83 mV on regulator 1) and is directly proportional to the output current. Additionally, since the PMOS pass element is a voltage-driven device, the quiescent current is very low and independent of output loading (maximum of 230  $\mu$ A over the full range of output current). This LDO family also features a sleep mode; applying a high signal to  $\overline{EN}$  (enable) shuts down both regulators, reducing the input current to 1  $\mu$ A at  $T_J = 25^\circ\text{C}$ .

The device is enabled when the  $\overline{EN}$  pin is connected to a low-level input voltage. The output voltages of the two regulators are sensed at the  $V_{SENSE1}$  and  $V_{SENSE2}$  pins respectively.

The input signal at the SEQ pin controls the power-up sequence of the two regulators. When the device is enabled and the SEQ terminal is pulled high or left open,  $V_{OUT2}$  turns on first and  $V_{OUT1}$  remains off until  $V_{OUT2}$  reaches approximately 83% of its regulated output voltage. At that time  $V_{OUT1}$  is turned on. If  $V_{OUT2}$  is pulled below 83% (i.e. over load condition)  $V_{OUT1}$  is turned off. Pulling the SEQ terminal low, reverses the power-up order and  $V_{OUT1}$  is turned on first. The SEQ pin is connected to an internal pullup current source.

For each regulator, there is an internal discharge transistor to discharge the output capacitor when the regulator is turned off(disabled).

The PG1 pin reports the voltage conditions at  $V_{OUT1}$ . Power good can be used to implement a SVS for the circuitry supplied by regulator 1.

The TPS707xx features a  $\overline{RESET}$  (SVS, POR, or Power On Reset).  $\overline{RESET}$  output initiates a reset in DSP systems and related digital applications in the event of an undervoltage condition.  $\overline{RESET}$  indicates the status of  $V_{OUT2}$  and both manual reset pins ( $\overline{MR1}$  and  $\overline{MR2}$ ). When  $V_{OUT2}$  reaches 95% of its regulated voltage and  $\overline{MR1}$  and  $\overline{MR2}$  are in the logic high state,  $\overline{RESET}$  goes to a high impedance state after 120 ms delay.  $\overline{RESET}$  goes to logic low state when  $V_{OUT2}$  regulated output voltage is pulled below 95% (i.e. over load condition) of its regulated voltage. To monitor  $V_{OUT1}$ , the PG1 output pin can be connected to  $\overline{MR1}$  or  $\overline{MR2}$ .

The device has an undervoltage lockout UVLO circuit which prevents the internal regulators from turning on until  $V_{IN1}$  reaches 2.5V.

### AVAILABLE OPTIONS

$T_J$	REGULATOR 1 $V_O$ (V)	REGULATOR 2 $V_O$ (V)	TSSOP (PWP)
-40°C to 125°C	3.3 V	1.2 V	TPS70745PWP
	3.3 V	1.5 V	TPS70748PWP
	3.3 V	1.8 V	TPS70751PWP
	3.3 V	2.5 V	TPS70758PWP
	Adjustable (1.22 V to 5.5 V)	Adjustable (1.22 V to 5.5 V)	TPS70702PWP

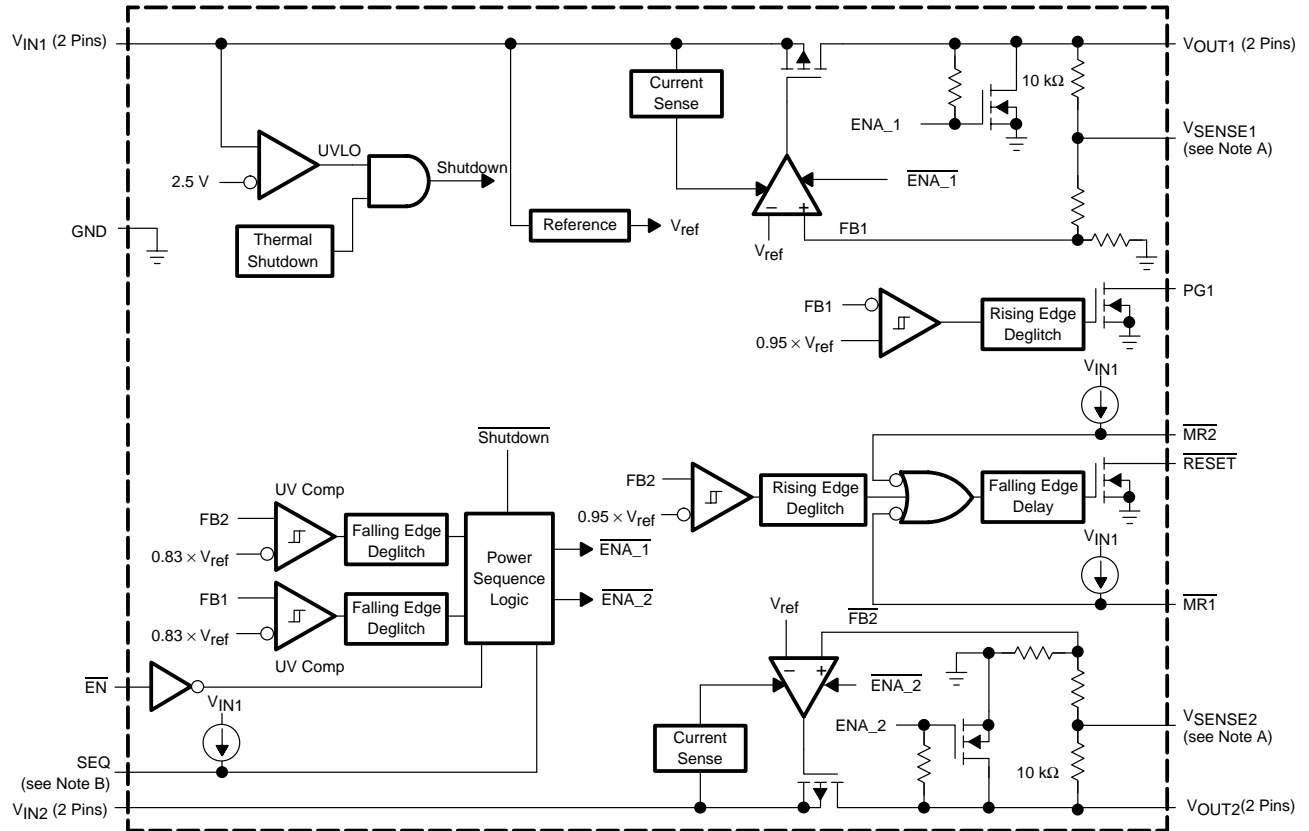

NOTE: The TPS70702 is programmable using external resistor dividers (see application information) The PWP package is available taped and reeled. Add an R suffix to the device type (e.g., TPS70702PWPR).

$V_{\text{SENSE1}}/\text{FB1}$	17	I	Regulator 1 output voltage sense/ regulator 1 feedback for adjustable

**detailed description**

The TPS707xx low dropout regulator family provides dual regulated output voltages for DSP applications that require a high-performance power management solution. These devices provide fast transient response and high accuracy with small output capacitors, while drawing low quiescent current. Programmable sequencing provides a power solution for DSPs without any external component requirements. This reduces the component cost and board space while increasing total system reliability. TPS707xx family has an enable feature which puts the device in sleep mode reducing the input currents to less than 3  $\mu\text{A}$ . Other features are integrated SVS (power on reset,  $\overline{\text{RESET}}$ ) and power good (PG1) that monitor output voltages and provide logic output to the system. These differentiated features provide a complete DSP power solution.

The TPS707xx, unlike many other LDOs, feature very low quiescent current which remains virtually constant even with varying loads. Conventional LDO regulators use a PNP pass element, the base current of which is directly proportional to the load current through the regulator ( $I_B = I_C/\beta$ ). The TPS707xx uses a PMOS transistor to pass current; because the gate of the PMOS is voltage driven, operating current is low and stable over the full load range.

**pin functions**

**enable**

The  $\overline{\text{EN}}$  terminal is an input which enables or shuts down the device. If  $\overline{\text{EN}}$  is at a voltage high signal the device is in shutdown mode. When the  $\overline{\text{EN}}$  goes to voltage low, then the device is enabled.

**sequence**

The SEQ terminal is an input that programs which output voltage ( $V_{\text{OUT1}}$  or  $V_{\text{OUT2}}$ ) is turned on first. When the device is enabled and the SEQ terminal is pulled high or left open,  $V_{\text{OUT2}}$  turns on first and  $V_{\text{OUT1}}$  remains off until  $V_{\text{OUT2}}$  reaches approximately 83% of its regulated output voltage. At that time the  $V_{\text{OUT1}}$  is turned on. If  $V_{\text{OUT2}}$  is pulled below 83% (i.e., over load condition)  $V_{\text{OUT1}}$  is turned off. This terminal has a 6- $\mu\text{A}$  pullup current to  $V_{\text{IN1}}$ .

Pulling the SEQ terminal low reverses the power-up order and  $V_{\text{OUT1}}$  is turned on first. For detail timing diagrams refer to Figures 36 and 42.

# TPS70745, TPS70748, TPS70751, TPS70758, TPS70702 DUAL-OUTPUT LOW-DROPOUT VOLTAGE REGULATORS WITH POWER-UP SEQUENCING FOR SPLIT VOLTAGE DSP SYSTEMS

SLVS291B – MAY 2000 – REVISED OCTOBER 2002

## **power-good**

The PG1 terminal is an open drain, active high output terminal which indicates the status of the  $V_{OUT1}$  regulator. When the  $V_{OUT1}$  reaches 95% of its regulated voltage, PG1 goes into a high impedance state. PG1 goes into a low impedance state when  $V_{OUT1}$  is pulled below 95% (i.e. over-load condition) of its regulated voltage. The open drain output of the PG1 terminal requires a pullup resistor.

## **manual reset pins ( $\overline{MR1}$ and $\overline{MR2}$ )**

$\overline{MR1}$  and  $\overline{MR2}$  are active low input terminals used to trigger a reset condition. When either  $\overline{MR1}$  or  $\overline{MR2}$  is pulled to logic low, a POR (RESET) occurs. These terminals have a 6- $\mu$ A pullup current to  $V_{IN1}$ .

## **sense ( $V_{SENSE1}$ , $V_{SENSE2}$ )**

The sense terminals of fixed-output options must be connected to the regulator output, and the connection should be as short as possible. Internally, sense connects to high-impedance wide-bandwidth amplifiers through a resistor-divider network and noise pickup feeds through to the regulator output. It is essential to route the sense connection in such a way to minimize/avoid noise pickup. Adding RC networks between the  $V_{SENSE}$  terminals and  $V_{OUT}$  terminals to filter noise is not recommended because it can cause the regulators to oscillate.

## **FB1 and FB2**

FB1 and FB2 are input terminals used for adjustable-output devices and must be connected to the external feedback resistor divider. FB1 and FB2 connections should be as short as possible. It is essential to route them in such a way as to minimize/avoid noise pickup. Adding RC networks between the FB terminals and  $V_{OUT}$  terminals to filter noise is not recommended because it can cause the regulators to oscillate.

## **RESET indicator**

The TPS707xx features a RESET (SVS, POR, or power on reset). RESET can be used to drive power-on reset circuitry or a low-battery indicator. RESET is an active low, open drain output which indicates the status of the  $V_{OUT2}$  regulator and both manual reset pins ( $\overline{MR1}$  and  $\overline{MR2}$ ). When  $V_{OUT2}$  exceeds 95% of its regulated voltage, and  $\overline{MR1}$  and  $\overline{MR2}$  are in the high impedance state, RESET goes to a high-impedance state after 120-ms delay. RESET goes to a low impedance state when  $V_{OUT2}$  is pulled below 95% (i.e. over load condition) of its regulated voltage. To monitor  $V_{OUT1}$ , PG1 output pin can be connected to  $\overline{MR1}$  or  $\overline{MR2}$ . The open drain output of the RESET terminal requires a pullup resistor. If RESET is not used, it can be left floating.

## **$V_{IN1}$ and $V_{IN2}$**

$V_{IN1}$  and  $V_{IN2}$  are input to the regulators. Internal bias voltages are powered by  $V_{IN1}$ .

## **$V_{OUT1}$ and $V_{OUT2}$**

$V_{OUT1}$  and  $V_{OUT2}$  are output terminals.

## APPLICATION INFORMATION

### sequencing timing diagrams

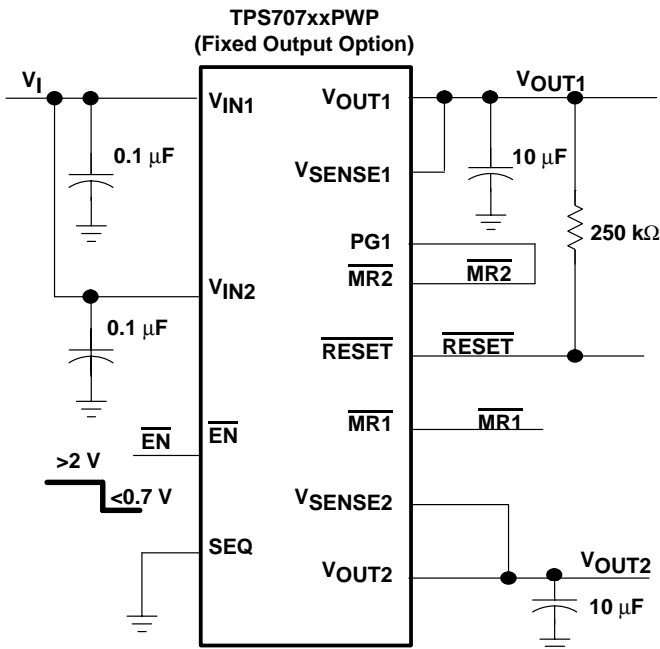

The following figures provide a timing diagram of how this device functions in different configurations.

#### application conditions not shown in block diagram:

$V_{IN1}$  and  $V_{IN2}$  are tied to the same fixed input voltage greater than the  $V_{UVLO}$ ; SEQ is tied to logic low; PG1 is tied to MR2; MR1 is left unconnected and is therefore at logic high.

#### explanation of timing diagrams:

$\overline{EN}$  is initially high; therefore, both regulators are off and PG1 and RESET are at logic low. With SEQ at logic low, when  $\overline{EN}$  is taken to logic low,  $V_{OUT1}$  turns on.  $V_{OUT2}$  turns on after  $V_{OUT1}$  reaches 83% of its regulated output voltage. When  $V_{OUT1}$  reaches 95% of its regulated output voltage, PG1 (tied to MR2) goes to logic high. When both  $V_{OUT1}$  and  $V_{OUT2}$  reach 95% of their respective regulated output voltages and both MR1 and MR2 (tied to PG1) are at logic high, RESET is pulled to logic high after a 120 ms delay. When  $\overline{EN}$  is returned to logic high, both devices power down and both PG1 (tied to MR2) and RESET return to logic low.

NOTE A:  $t_1$  – Time at which both  $V_{OUT1}$  and  $V_{OUT2}$  are greater than the PG thresholds and MR1 is logic high.

**Figure 36. Timing When SEQ = Low**

 DUAL-OUTPUT LOW-DROPOUT VOLTAGE REGULATORS  
 WITH POWER-UP SEQUENCING FOR SPLIT VOLTAGE DSP SYSTEMS**

SLVS291B – MAY 2000 – REVISED OCTOBER 2002

**APPLICATION INFORMATION**

**input capacitor**

For a typical application, an input bypass capacitor (0.1  $\mu\text{F}$  – 1  $\mu\text{F}$ ) is recommended. This capacitor filters any high frequency noise generated in the line. For fast transient condition where droop at the input of the LDO may occur due to high inrush current, it is recommended to place a larger capacitor at the input as well. The size of this capacitor is dependant on the output current and response time of the main power supply, as well as the distance to the  $V_I$  pins of the LDO.

**output capacitor**

As with most LDO regulators, the TPS707xx requires an output capacitor connected between OUT and GND to stabilize the internal control loop. The minimum recommended capacitance values are 10  $\mu\text{F}$  ceramic capacitors with an ESR (equivalent series resistance) between 50 m $\Omega$  and 2.5  $\Omega$  or 6.8  $\mu\text{F}$  tantalum capacitors with ESR between 250 m $\Omega$  and 4  $\Omega$ . Solid tantalum electrolytic, aluminum electrolytic, and multilayer ceramic capacitors with capacitance values greater than 10  $\mu\text{F}$  are all suitable, provided they meet the requirements described above. Larger capacitors provide a wider range of stability and better load transient response. Below is a partial listing of surface-mount capacitors usable with the TPS707xx for fast transient response application.

This information, along with the ESR graphs, is included to assist in selection of suitable capacitance for the user's application. When necessary to achieve low height requirements along with high output current and/or high load capacitance, several higher ESR capacitors can be used in parallel to meet the guidelines above.

VALUE	MFR.	MAX ESR†	PART NO.
22 $\mu\text{F}$	Kemet	345 m $\Omega$	7495C226K0010AS
33 $\mu\text{F}$	Sanyo	100 m $\Omega$	10TPA33M
47 $\mu\text{F}$	Sanyo	100 m $\Omega$	6TPA47M
68 $\mu\text{F}$	Sanyo	45 m $\Omega$	10TPC68M

**ESR and transient response**

LDOs typically require an external output capacitor for stability. In fast transient response applications, capacitors are used to support the load current while LDO amplifier is responding. In most applications, one capacitor is used to support both functions.

Besides its capacitance, every capacitor also contains parasitic impedances. These parasitic impedances are resistive as well as inductive. The resistive impedance is called equivalent series resistance (ESR), and the inductive impedance is called equivalent series inductance (ESL). The equivalent schematic diagram of any capacitor can therefore be drawn as shown in Figure 43.

**Figure 43. – ESR and ESL**

In most cases one can neglect the effect of inductive impedance ESL. Therefore, the following application focuses mainly on the parasitic resistance ESR.

APPLICATION INFORMATION

Figure 44 shows the output capacitor and its parasitic impedances in a typical LDO output stage.

Figure 44. LDO Output Stage With Parasitic Resistances ESR

In steady state (dc state condition), the load current is supplied by the LDO (solid arrow) and the voltage across the capacitor is the same as the output voltage ( $V(C_O) = V_O$ ). This means no current is flowing into the  $C_O$  branch. If  $I_O$  suddenly increases (transient condition), the following occurs:

The LDO is not able to supply the sudden current need due to its response time ( $t_1$  in Figure 45). Therefore, capacitor  $C_O$  provides the current for the new load condition (dashed arrow).  $C_O$  now acts like a battery with an internal resistance, ESR. Depending on the current demand at the output, a voltage drop occurs at  $R_{ESR}$ . This voltage is shown as  $V_{ESR}$  in Figure 44.

When  $C_O$  is conducting current to the load, initial voltage at the load will be  $V_O = V(C_O) - V_{ESR}$ . Due to the discharge of  $C_O$ , the output voltage  $V_O$  drops continuously until the response time  $t_1$  of the LDO is reached and the LDO resumes supplying the load. From this point, the output voltage starts rising again until it reaches the regulated voltage. This period is shown as  $t_2$  in Figure 45.

The figure also shows the impact of different ESRs on the output voltage. The left brackets show different levels of ESRs where number 1 displays the lowest and number 3 displays the highest ESR.

From above, the following conclusions can be drawn:

- The higher the ESR, the larger the droop at the beginning of load transient.
- The smaller the output capacitor, the faster the discharge time and the bigger the voltage droop during the LDO response period.

# TPS70745, TPS70748, TPS70751, TPS70758, TPS70702 DUAL-OUTPUT LOW-DROPOUT VOLTAGE REGULATORS WITH POWER-UP SEQUENCING FOR SPLIT VOLTAGE DSP SYSTEMS

SLVS291B – MAY 2000 – REVISED OCTOBER 2002

## APPLICATION INFORMATION

### conclusion

To minimize the transient output droop, capacitors must have a low ESR and be large enough to support the minimum output voltage requirement.

Figure 45. – Correlation of Different ESRs and Their Influence to the Regulation of  $V_O$  at a Load Step From Low-to-High Output Current

## APPLICATION INFORMATION

### programming the TPS70702 adjustable LDO regulator

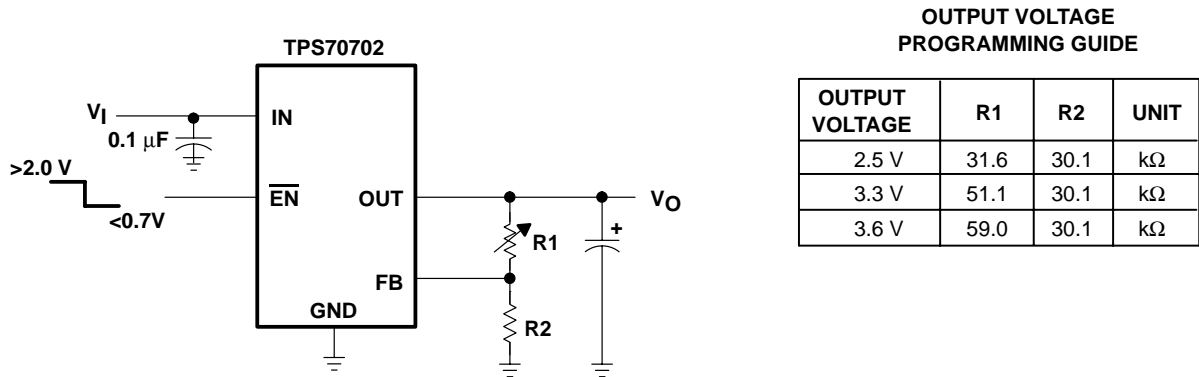

The output voltage of the TPS70702 adjustable regulators is programmed using external resistor dividers as shown in Figure 46.

Resistors R1 and R2 should be chosen for approximately 50  $\mu\text{A}$  divider current. Lower value resistors can be used, but offer no inherent advantage and waste more power. Higher values should be avoided as leakage currents at the sense terminal increase the output voltage error. The recommended design procedure is to choose R2 = 30.1 k $\Omega$  to set the divider current at approximately 50  $\mu\text{A}$  and then calculate R1 using:

$$R1 = \left( \frac{V_O}{V_{\text{ref}}} - 1 \right) \times R2$$

where

$V_{\text{ref}} = 1.224 \text{ V typ}$  (the internal reference voltage)

**OUTPUT VOLTAGE  
PROGRAMMING GUIDE**

OUTPUT VOLTAGE	R1	R2	UNIT
2.5 V	31.6	30.1	k $\Omega$
3.3 V	51.1	30.1	k $\Omega$
3.6 V	59.0	30.1	k $\Omega$

**Figure 46. TPS70702 Adjustable LDO Regulator Programming**

### regulator protection

Both TPS707xx PMOS-pass transistors have built-in back diodes that conduct reverse currents when the input voltage drops below the output voltage (e.g., during power down). Current is conducted from the output to the input and is not internally limited. When extended reverse voltage is anticipated, external limiting may be appropriate.

The TPS707xx also features internal current limiting and thermal protection. During normal operation, the TPS707xx regulator 1 limits output current to approximately 1.6 A (typ) and regulator 2 limits output current to approximately 750 mA (typ). When current limiting engages, the output voltage scales back linearly until the overcurrent condition ends. While current limiting is designed to prevent gross device failure, care should be taken not to exceed the power dissipation ratings of the package. If the temperature of the device exceeds 150°C (typ), thermal-protection circuitry shuts it down. Once the device has cooled below 130°C (typ), regulator operation resumes.

## power dissipation and junction temperature

Specified regulator operation is assured to a junction temperature of 125°C; the maximum junction temperature should be restricted to 125°C under normal operating conditions. This restriction limits the power dissipation the regulator can handle in any given application. To ensure the junction temperature is within acceptable limits, calculate the maximum allowable dissipation,  $P_{D(max)}$ , and the actual dissipation,  $P_D$ , which must be less than or equal to  $P_{D(max)}$ .

The maximum-power-dissipation limit is determined using the following equation:

$$P_{D(max)} = \frac{T_{Jmax} - T_A}{R_{\theta JA}}$$

where

$T_{Jmax}$  is the maximum allowable junction temperature.

$R_{\theta JA}$  is the thermal resistance junction-to-ambient for the package, i.e., 32.6°C/W for the 20-terminal PWP with no airflow.

$T_A$  is the ambient temperature.

The regulator dissipation is calculated using:

$$P_D = (V_I - V_O) \times I_O$$

Power dissipation resulting from quiescent current is negligible. Excessive power dissipation triggers the thermal protection circuit.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
