TEXAS INSTRUMENTS

DS90UB927Q-Q1

SNLS416D –JUNE 2012–REVISED JANUARY 2015

DS90UB927Q-Q1 5-MHz to 85-MHz 24-bit Color FPD-Link III Serializer With Bidirectional Control Channel

1 Features

- Bidirectional Control Channel Interface with I²C-compatible Serial Control Bus
- Low EMI FPD-Link Video Input
- Supports High Definition (720p) Digital Video Format
- 5-MHz to 85-MHz PCLK Supported
- RGB888 + VS, HS, DE and I²S Audio Supported
- Up to 4 I²S Digital Audio Inputs for Surround Sound Applications
- 4 Bidirectional GPIO Channels with 2 Dedicated Pins
- Single 3.3-V Supply with 1.8-V or 3.3-V Compatible LVCMOS I/O Interface
- AC-Coupled STP Interconnect Up to 10 Meters
- DC-Balanced and Scrambled Data With Embedded Clock
- Supports Repeater Application
- Internal Pattern Generation
- Low Power Modes Minimize Power Dissipation
- Automotive Grade Product: AEC-Q100 Grade 2 Qualified
- >8-kV HBM and ISO 10605 ESD Rating
- Backward Compatible Modes

2 Applications

- Automotive Displays for Navigation
- Rear Seat Entertainment Systems
- Automotive Driver Assistance
- Automotive Megapixel Camera Systems

3 Description

The DS90UB927Q-Q1 serializer, in conjunction with a DS90UB928Q-Q1 or DS90UB926Q-Q1 deserializer, provides a complete digital interface for concurrent transmission of high-speed video, audio, and control data for automotive display and image sensing applications.

The chipset is ideally suited for automotive video display systens with HD formats and automotive vision systems with megapixel resolutions. The DS90UB927Q-Q1 incorporates an embedded bidirectional control channel and low latency GPIO controls. This device translates a FPD-Link video interface into a single-pair high-speed serialized interface. The FPD-Link III serial bus scheme supports full duplex, high speed forward channel data transmission and low-speed back channel communication over a single differential link. Consolidation of audio, video, and control data over a single differential pair reduces the interconnect size and weight, while also eliminating skew issues and simplifying system design.

The DS90UB927Q-Q1 serializer embeds the clock and level shifts the signals to high-speed differential signaling. Up to 24 RGB data bits are serialized along with three video control signals, and up to four I²S data inputs.
The FPD-Link data interface allows for easy interfacing with data sources while also minimizing EMI and bus width. EMI on the high-speed FPD-Link III bus is minimized using low voltage differential signaling, data scrambling and randomization, and DC-balancing.

Device Information[1]

PART NUMBER	PACKAGE	BODY SIZE (NOM)
DS90UB927Q-Q1	WQFN (40)	6.00 mm x 6.00 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision C (October 2012) to Revision D   **Page**

- Added *ESD Ratings* table, *Feature Description* section, *Device Functional Modes*, *Application and Implementation* section, *Power Supply Recommendations* section, *Layout* section, *Device and Documentation Support* section, and *Mechanical, Packaging, and Orderable Information* section 1

Changes from Revision B (June 2012) to Revision C   **Page**

- Changed layout of National data sheet to tI format... 49

5 Pin Configuration and Functions

RTA Package
40-Pin WQFN With Exposed Thermal Pad
Top View
Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
FPD-LINK INPUT INTERFACE			
RxCLKIN-	35	I, LVDS	Inverting LVDS Clock Input The pair requires external 100-Ω differential termination for standard LVDS levels
RxCLKIN+	36	I, LVDS	True LVDS Clock Input The pair requires external 100-Ω differential termination for standard LVDS levels
RxIN[3:0]-	37, 33, 31, 29	I, LVDS	Inverting LVDS Data Inputs Each pair requires external 100-Ω differential termination for standard LVDS levels
RxIN[3:0]+	38, 34, 32, 30	I, LVDS	True LVDS Data Inputs Each pair requires external 100-Ω differential termination for standard LVDS levels
LVCMOS PARALLEL INTERFACE			
BKWD	22	I, LVCMOS with pulldown	Backward Compatible Mode Select BKWD = 0, interfacing to DS90UH926/8Q-Q1 (Default) BKWD = 1, interfacing to DS90UR906/8Q-Q1, DS90UR916Q Requires a 10-kΩ pullup if set HIGH
GPIO[1:0]	40, 39	I/O, LVCMOS with pulldown	General Purpose I/O See Table 1
I2S_DA I2S_DB I2S_DC I2S_DD	3 4 5 6	I, LVCMOS with pulldown	Digital Audio Interface I^{2}S Data Inputs Shared with GPIO_REG6, GPIO_REG5, GPIO2, GPIO3
I2S_WC I2S_CLK	1 2	I, LVCMOS with pulldown	Digital Audio Interface I^{2}S Word Clock and I^{2}S Bit Clock Inputs Shared with GPIO_REG7 and GPIO_REG8 (Table 3)

Product Folder Links: *DS90UB927Q-Q1*

Pin Functions (continued)

PIN		I/O	DESCRIPTION
NAME	NO.		
LFMODE	25	I, LVCMOS with pulldown	Low Frequency Mode Select LFMODE = 0, 15 MHz ≤ RxCLKIN ≤ 85 MHz (Default) LFMODE = 1, 5 MHz ≤ RxCLKIN < 15 MHz Requires a 10-kΩ pullup if set HIGH
MAPSEL	23	I, LVCMOS with pulldown	FPD-Link Input Map Select MAPSEL = 0, LSBs on RxIN3± (Default) MAPSEL = 1, MSBs on RxIN3± See Figure 19 and Figure 20 Requires a 10-kΩ pullup if set HIGH
REPEAT	21	I, LVCMOS with pulldown	Repeater Mode Select REPEAT = 0, Repeater Mode disabled (Default) REPEAT = 1, Repeater Mode enabled Requires a 10-kΩ pullup if set HIGH
OPTIONAL PARALLEL INTERFACE			
GPIO[3:2]	6, 5	I/O, LVCMOS with pulldown	General Purpose I/O Shared with I2S_DD and I2S_DC (See Table 1)
GPIO_REG [8:5]	2, 1, 3, 4	I/O, LVCMOS with pulldown	Register-Only General Purpose I/O Shared with I2S_CLK, I2S_WC, I2S_DA, I2S_DB (See Table 2)
CONTROL AND CONFIGURATION			
IDx	11	I, Analog	I^2C Address Select External pullup to V_{DD33} is required under all conditions. **DO NOT FLOAT.** Connect to external pullup to V_{DD33} and pulldown to GND to create a voltage divider. See Figure 25 and Table 4
PDB	18	I, LVCMOS with pulldown	Power-down Mode Input Pin Must be driven or pulled up to V_{DD33}. Refer to *Power Supply Recommendations.* PDB = H, device is enabled (normal operation) PDB = L, device is powered down. When the device is in the powered down state, the Driver Outputs are both HIGH, the PLL is shutdown, and I_{DD} is minimized. Control Registers are **RESET.**
SCL	9	I/O, LVCMOS Open Drain	I^2C Clock Input / Output Interface Must have an external pullup to V_{DD33}. **DO NOT FLOAT.** Recommended pullup: 4.7 kΩ.
SDA	10	I/O, LVCMOS Open Drain	I^2C Data Input / Output Interface Must have an external pullup to V_{DD33}. **DO NOT FLOAT.** Recommended pullup: 4.7 kΩ.
STATUS			
INTB	27	O, LVCMOS Open Drain	Interrupt INTB = H, normal INTB = L, Interrupt request Recommended pullup: 4.7 kΩ to V_{DDIO}. **DO NOT FLOAT.**
FPD-LINK III SERIAL INTERFACE			
CMF	20	Analog	Common Mode Filter. Connect 0.1 µF to GND (required)
DOUT-	16	I/O, LVDS	Inverting Output The output must be AC-coupled with a 0.1-µF capacitor.
DOUT+	17	I/O, LVDS	True Output The output must be AC-coupled with a 0.1-µF capacitor.

Product Folder Links: *DS90UB927Q-Q1*

Pin Functions (continued)

PIN		I/O	DESCRIPTION
NAME	NO.		
POWER[1] **AND GROUND**			
GND	DAP	Ground	Large metal contact at the bottom center of the device package **Connect to the ground plane (GND) with at least 9 vias.**
VDD33_A VDD33_B	19 26	Power	Power to on-chip regulator **3.0 V - 3.6 V**. Each pin requires a 4.7-µF capacitor to GND
VDDIO	7, 24	Power	LVCMOS I/O Power **1.8 V ±5% OR 3.0 V - 3.6 V**. Each pin requires 4.7-µF capacitor to GND
REGULATOR CAPACITOR			
CAPL12	8	CAP	Decoupling capacitor connection for on-chip regulator Requires two 4.7-µF decoupling capacitors to GND
CAPP12 CAPHS12 CAPLVD12	12 14 28	CAP	Decoupling capacitor connection for on-chip regulator Each requires a 4.7-µF decoupling capacitor to GND.
OTHER			
RES[1:0]	15, 13	GND	Reserved Connect to GND.

(1) The V_{DD} (V_{DD33} and V_{DDIO}) supply ramp should be faster than 1.5 ms with a monotonic rise.

6 Specifications

6.1 Absolute Maximum Ratings[1][2][3]

	MIN	MAX	UNIT
Supply Voltage – V_{DD33}	−0.3	4.0	V
Supply Voltage – V_{DDIO}	−0.3	4.0	V
LVCMOS I/O Voltage	−0.3	V_{DDIO} + 0.3	V
Serializer Output Voltage	−0.3	2.75	V
Junction Temperature		150	°C
Storage Temperature, T_{stg}	−65	150	°C

(1) For soldering specifications: see product folder at www.ti.com and SNOA549.
(2) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(3) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.

6.2 ESD Ratings

				VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per AEC Q100-002[1]		±8000	V
		Charged device model (CDM), per AEC Q100-011		±1250	
		Machine model (MM)		±250	
		(IEC 61000-4-2, powered-up only) R_D = 330 Ω, C_S = 150 pF	Air Discharge (Pin 16 and 17)	±15000	
			Contact Discharge (Pin 16 and 17)	±8000	
		(ISO 10605) R_D = 330 Ω, C_S = 150 pF/330 pF R_D = 2 kΩ, C_S = 150 pF/330 pF	Air Discharge (Pin 16 and 17)	±15000	
			Contact Discharge (Pin 16 and 17)	±8000	

(1) AEC Q100-002 indicates HBM stressing is done in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Supply Voltage (V_{DD33})		3.0	3.3	3.6	V
LVCMOS Supply Voltage (V_{DDIO})[1]	Connect V_{DDIO} to 3.3 V and use 3.3-V IOs	3.0	3.3	3.6	V
	Connect V_{DDIO} to 1.8 V and use 1.8-V IOs	1.71	1.8	1.89	
Operating Free Air Temperature (T_A)		−40	+25	+105	°C
PCLK Frequency		5		85	MHz
Supply Noise[2]				100	mV_{P-P}

(1) $V_{DDIO} < V_{DD33}$ + 0.3 V
(2) Supply noise testing was done with minimum capacitors on the PCB. A sinusoidal signal is AC coupled to the V_{DD33} and V_{DDIO} supplies with amplitude = 100 mVp-p measured at the device V_{DD33} and V_{DDIO} pins. Bit error rate testing of input to the Ser and output of the Des with 10 meter cable shows no error when the noise frequency on the Ser is less than 50 MHz. The Des on the other hand shows no error when the noise frequency is less than 50 MHz.

6.4 Thermal Information

THERMAL METRIC[1]		DS90UB927Q-Q1 RTA (WQFN) 40 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	29.0	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	14.4	
$R_{\theta JB}$	Junction-to-board thermal resistance	5.1	
ψ_{JT}	Junction-to-top characterization parameter	0.2	
ψ_{JB}	Junction-to-board characterization parameter	5.1	
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	1.4	

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, SPRA953.

6.5 DC Electrical Characteristics

Over recommended operating supply and temperature ranges unless otherwise specified. [(1)(2)(3)]

PARAMETER		TEST CONDITIONS		PIN / FREQ	MIN	NOM	MAX	UNIT
LVCMOS I/O								
V_{IH}	High Level Input Voltage	V_{DDIO} = 3.0 V to 3.6 V [(4)]		PDB	2.0		V_{DDIO}	V
V_{IL}	Low Level Input Voltage	V_{DDIO} = 3.0 V to 3.6 V [(4)]			GND		0.8	V
I_{IN}	Input Current	V_{IN} = 0 V or V_{DDIO} = 3.0 V to 3.6 V [(4)]			−15	±1	+15	µA
V_{IH}	High Level Input Voltage	V_{DDIO} = 3.0 V to 3.6 V		GPIO[1:0] I2S_CLK I2S_WC I2S_D[A,B,C,D] LFMODE MAPSEL BKWD REPEAT	2.0		V_{DDIO}	V
		V_{DDIO} = 1.71 V to 1.89 V			0.65*V_{DDIO}		V_{DDIO}	V
V_{IL}	Low Level Input Voltage	V_{DDIO} = 3.0 V to 3.6 V			GND		0.8	V
		V_{DDIO} = 1.71 V to 1.89 V			GND		0.35*V_{DDIO}	V
I_{IN}	Input Current	V_{IN} = 0 V or V_{DDIO}	V_{DDIO} = 3.0 V to 3.6 V		−15	±1	+15	µA
			V_{DDIO} = 1.71 V to 1.89 V		−15	±1	+15	µA
V_{OH}	High Level Output Voltage	I_{OH} = −4 mA	V_{DDIO} = 3.0 V to 3.6 V	GPIO[3:0], GPO_REG[8:5]	2.4		V_{DDIO}	V
			V_{DDIO} = 1.71 V to 1.89 V		V_{DDIO} - 0.45		V_{DDIO}	V
V_{OL}	Low Level Output Voltage	I_{OL} = +4 mA	V_{DDIO} = 3.0 V to 3.6 V		GND		0.4	V
			V_{DDIO} = 1.71 V to 1.89 V		GND		0.45	V
I_{OS}	Output Short Circuit Current	V_{OUT} = 0 V				−55		mA
I_{OZ}	Tri-state Output Current	V_{OUT} = 0 V or V_{DDIO}, PDB = L			−15		+15	µA

(1) The *Electrical Characteristics* tables list verified specifications under the listed *Recommended Operating Conditions* except as otherwise modified or specified by the *Electrical Characteristics* conditions and/or notes. Typical specifications are estimations only and are not verified.

(2) Typical values represent most likely parametric norms at V_{DD33} = 3.3 V, V_{DDIO} = 1.8 V or 3.3 V, T_A = 25°C, and at the *Recommended Operating Conditions* at the time of product characterization and are not verified.

(3) Current into device pins is defined as positive. Current out of a device pin is defined as negative. Voltages are referenced to ground except V_{OD} and ΔV_{OD}, which are differential voltages. Supply noise testing was done with minimum capacitors on the PCB. A sinusoidal signal is AC coupled to the supply pins with amplitude = 100 mVp-p measured at the device V_{DD33} and V_{DDIO} pins. Bit error rate testing of input to the serializer and output of the deserializer with 10 meter cable shows no error when the noise frequency is less than 50 MHz.

(4) PDB is specified to 3.3 V LVCMOS only and must be driven or pulled up to V_{DD33} or to V_{DDIO} ≥ 3.0 V

DC Electrical Characteristics (continued)

Over recommended operating supply and temperature ranges unless otherwise specified.[(1)(2)(3)]

PARAMETER		TEST CONDITIONS	PIN / FREQ	MIN	NOM	MAX	UNIT
FPD-LINK LVDS RECEIVER							
V_{TH}	Threshold High Voltage	V_{CM} = 1.2 V	RxCLKIN± RxIN[3:0]±			+100	mV
V_{TL}	Threshold Low Voltage			−100			mV
$|V_{ID}|$	Differential Input Voltage Swing			200		600	mV
V_{CM}	Common Mode Voltage			0	1.2	2.4	V
I_{IN}	Input Current			−10		+10	µA
FPD-LINK III CML DRIVER							
V_{ODp-p}	Differential Output Voltage (DOUT+) – (DOUT-)	R_L = 100 Ω (Figure 1)	DOUT±	800	1000	1200	mV$_{p-p}$
ΔV_{OD}	Output Voltage Unbalance				1	50	mV
V_{OS}	Offset Voltage – Single-ended	R_L = 100 Ω (Figure 1)			2.5-0.25* V_{ODp-p} (TYP)		V
ΔV_{OS}	Offset Voltage Unbalance Single-ended				1	50	mV
I_{OS}	Output Short Circuit Current	DOUT+/- = 0 V, PDB = L or H[(5)]			−30		mA
R_T	Internal Termination Resistance - Differential			80	100	120	Ω
SUPPLY CURRENT							
I_{DD1}	Supply Current R_L = 100 Ω, PCLK = 85 MHz	Checkerboard Pattern (Figure 8)	V_{DD33}= 3.6 V		135	160	mA
I_{DDIO1}			V_{DDIO} = 3.6 V		100	500	µA
			V_{DDIO} = 1.89 V		200	600	µA
I_{DD2}		Random Pattern PRBS7	V_{DD33}= 3.6 V		133		mA
I_{DDIO2}			V_{DDIO} = 3.6 V		100		µA
			V_{DDIO} = 1.89 V		100		µA
I_{DDS}	Supply Current – Remote Auto Power Down	reg_0x01[7]=1, Back channel Idle	V_{DD33} = 3.6 V		1.2	2.4	mA
I_{DDIOS}			V_{DDIO} = 3.6 V		4	30	µA
			V_{DDIO} = 1.89 V		5	30	µA
I_{DDZ}	Supply Current – Power Down	PDB = 0 V, All other LVCMOS inputs = 0 V	V_{DD33} = 3.6 V		1	2.2	mA
I_{DDIOZ}			V_{DDIO} = 3.6 V		8	20	µA
			V_{DDIO} = 1.89 V		4	20	µA

(5) I_{OS} is not specified for an indefinite period of time. Do not hold in short circuit for more than 500 ms or part damage may result

6.6 AC Electrical Characteristics

over operating free-air temperature range (unless otherwise noted) [1] [2] [3]

PARAMETER		TEST CONDITIONS	PIN / FREQ	MIN	TYP	MAX	UNIT
FPD-LINK LVDS INPUT							
t_{RSP}	Receiver Strobe Position	See Figure 4	RxCLKIN±, RXIN[3:0]±	0.25	0.5	0.75	UI
AC ELECTRICAL CHARACTERISTICS - FPD-LINK III CML IO							
t_{LHT}	CML Output Low-to-High Transition Time	See Figure 3	DOUT+, DOUT-		100	140	ps
t_{HLT}	CML Output High-to-Low Transition Time				100	140	ps
t_{PLD}	Serializer PLL Lock Time	See Figure 5 [4]	PCLK = 5MHz to 85MHz			5	ms
t_{SD}	Delay — Latency	See Figure 6			146*T		ns
t_{TJIT}	Output Total Jitter, Bit Error Rate ≤1E-9 Figure 7 [5] [6] [7] [8] [9]	Checkerboard Pattern PCLK=5 MHz, Figure 8	RxCLKIN±		0.17	0.2	UI
		Checkerboard Pattern PCLK=85 MHz, Figure 8			0.26	0.29	UI
t_{IJIT}	Input Jitter Tolerance, Bit Error Rate ≤1E-9 [6] [10]	f/40 < Jitter Freq < f/20, DES = DS90UB926Q-Q1	RxCLKIN±, f = 78 MHz		0.6		UI
		f/40 < Jitter Freq < f/20, DES = DS90UB928Q-Q1			0.5		UI
AC ELECTRICAL CHARACTERISTICS - I2S RECEIVER							
T_{I2S}	I^2S Clock Period [5] [11]	RxCLKIN± f=5 MHz to 85 MHz	I2S_CLK, PCLK = 5 MHz to 85 MHz	>4/PCLK or >77			ns
T_{HC}	I^2S Clock High Time [11]		I2S_CLK	0.35			T_{I2S}
T_{LC}	I^2S Clock Low Time [11]		I2S_CLK	0.35			T_{I2S}
t_{sr}	I^2S Set-up Time		I2S_WC I2S_D[A,B,C,D]	0.2			T_{I2S}
t_{htr}	I^2S Hold Time		I2S_WC I2S_D[A,B,C,D]	0.2			T_{I2S}
AC ELECTRICAL CHARACTERISTICS - OTHER I/O							
$t_{GPIO,FC}$	GPIO Pulse Width, Forward Channel		GPIO[3:0], PCLK = 5 MHz to 85 MHz	>2/PCLK			s
$t_{GPIO,BC}$	GPIO Pulse Width, Back Channel		GPIO[3:0]	20			µs

(1) The *Electrical Characteristics* tables list verified specifications under the listed *Recommended Operating Conditions* except as otherwise modified or specified by the *Electrical Characteristics* conditions and/or notes. Typical specifications are estimations only and are not verified.

(2) Typical values represent most likely parametric norms at V_{DD33} = 3.3 V, V_{DDIO} = 1.8 V or 3.3 V, T_A = 25°C, and at the *Recommended Operating Conditions* at the time of product characterization and are not verified.

(3) Current into device pins is defined as positive. Current out of a device pin is defined as negative. Voltages are referenced to ground except V_{OD} and ΔV_{OD}, which are differential voltages. Supply noise testing was done with minimum capacitors on the PCB. A sinusoidal signal is AC coupled to the supply pins with amplitude = 100 mVp-p measured at the device V_{DD33} and V_{DDIO} pins. Bit error rate testing of input to the serializer and output of the deserializer with 10 meter cable shows no error when the noise frequency is less than 50 MHz.

(4) t_{PLD} is the time required by the device to obtain lock when exiting power-down state with an active PCLK.

(5) Specification is verified by design and is not tested in production

(6) Specification is verified by characterization and is not tested in production

(7) UI – Unit Interval is equivalent to one ideal serialized bit width. The UI scales with PCLK frequency.

(8) Output jitter specs are dependent upon the input clock jitter at the SER

(9) t_{TJIT} (@BER of 1E-9) specifies the allowable jitter on RxCLKIN±.

(10) Jitter Frequency is specified in conjunction with DS90UB928Q-Q1 PLL bandwidth.

(11) I^2S specifications for t_{LC} and t_{HC} pulses must each be greater than 2 PCLK periods to verify sampling and supersedes the 0.35*T_{I2S_CLK} requirement. t_{LC} and t_{HC} must be longer than the greater of either 0.35*T_{I2S_CLK} or 2*PCLK

AC Electrical Characteristics (continued)

		Fast mode			300	

(1) The *Electrical Characteristics* tables list verified specifications under the listed *Recommended Operating Conditions* except as otherwise modified or specified by the *Electrical Characteristics* conditions and/or notes. Typical specifications are estimations only and are not verified.
(2) Typical values represent most likely parametric norms at V_{DD33} = 3.3 V, V_{DDIO} = 1.8 V or 3.3 V, T_A = 25°C, and at the *Recommended Operating Conditions* at the time of product characterization and are not verified.
(3) Current into device pins is defined as positive. Current out of a device pin is defined as negative. Voltages are referenced to ground except V_{OD} and ΔV_{OD}, which are differential voltages. Supply noise testing was done with minimum capacitors on the PCB. A sinusoidal signal is AC coupled to the supply pins with amplitude = 100 mVp-p measured at the device V_{DD33} and V_{DDIO} pins. Bit error rate testing of input to the serializer and output of the deserializer with 10 meter cable shows no error when the noise frequency is less than 50 MHz.

7 Detailed Description

7.1 Overview

The DS90UB927Q-Q1 converts a FPD-Link interface (4 LVDS data channels + 1 LVDS Clock) to a FPD-Link III interface. This device transmits a 35-bit symbol over a single serial pair operating at up to a 2.975-Gbps line rate. The serial stream contains an embedded clock, video control signals, RGB video data, and audio data. The payload is DC-balanced to enhance signal quality and support AC coupling.

The DS90UB927Q-Q1 serializer is intended for use with a DS90UB928Q-Q1 or DS90UB926Q-Q1 deserializer, but is also backward compatible with DS90UR906Q, DS90UR908Q, DS90UR910Q, and DS90UR916Q FPD-Link II deserializers.

The DS90UB927Q-Q1 serializer and DS90UB928Q-Q1 or DS90UB926Q-Q1 deserializer incorporate an I^2C compatible interface. The I^2C compatible interface allows programming of serializer or deserializer devices from a local host controller. In addition, the devices incorporate a bidirectional control channel (BCC) that allows communication between serializer/deserializer as well as remote I^2C slave devices.

The bidirectional control channel (BCC) is implemented via embedded signaling in the high-speed forward channel (serializer to deserializer) combined with lower speed signaling in the reverse channel (deserializer to serializer). Through this interface, the BCC provides a mechanism to bridge I^2C transactions across the serial link from one I^2C bus to another. The implementation allows for arbitration with other I^2C compatible masters at either side of the serial link.

There are two operating modes available on DS90UB927Q-Q1: display mode and camera mode. In display mode, I^2C transactions originate from the host controller attached to the serializer and target either the deserializer or an I^2C slave attached to the deserializer. Transactions are detected by the I^2C slave in the serializer and forwarded to the I^2C master in the deserializer. Similarly, in camera mode, I^2C transactions originate from a controller attached to the deserializer and target either the serializer or an I^2C slave attached to the serializer. Transactions are detected by the I^2C slave in the deserializer and forwarded to the I^2C master in the serializer.

7.2 Functional Block Diagram

Product Folder Links: *DS90UB927Q-Q1*
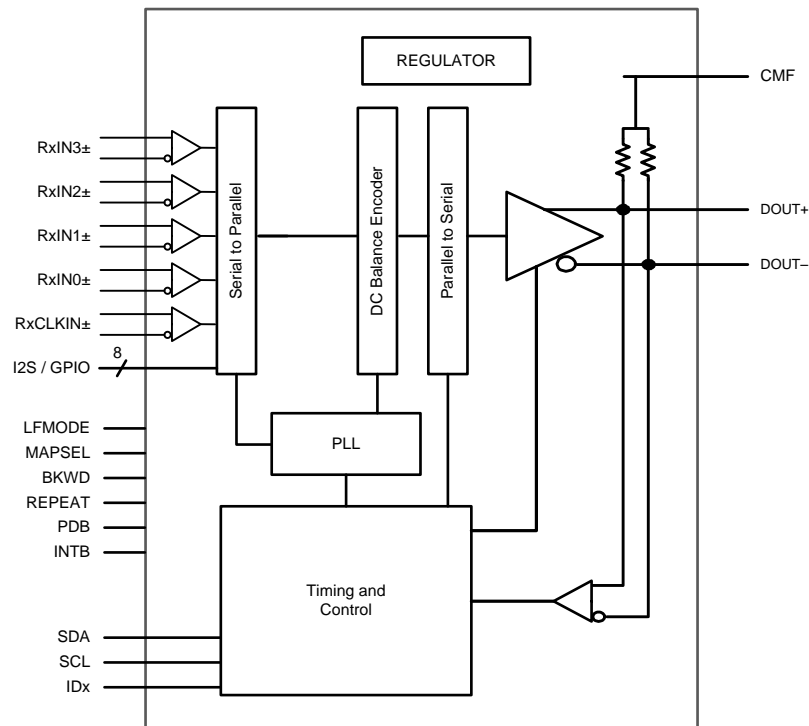

7.3 Feature Description

7.3.1 High-Speed Forward Channel Data Transfer

The High Speed Forward Channel is composed of a 35-bit frame containing RGB data, sync signals, I^2C, and I^2S audio transmitted from Serializer to Deserializer. Figure 13 illustrates the serial stream generated per PCLK cycle into RxCLKIN±. This data payload is optimized for signal transmission over an AC coupled link. Data is randomized, DC-balanced and scrambled.

Figure 13. FPD-Link III Serial Stream

The device supports pixel clock ranges of 5 MHz to 15 MHz (LFMODE=1) and 15 MHz to 85 MHz (LFMODE=0). This corresponds to an application payload rate range of 155 Mbps to 2.635 Gbps, with an actual line rate range of 525 Mbps to 2.975 Gbps.

7.3.2 Low-Speed Back Channel Data Transfer

The Low-Speed Back Channel of the DS90UB927Q-Q1 provides bidirectional communication between the display and host processor. Data is transferred simultaneously over the same physical link as the high-speed forward channel data. The back channel transports I^2C, CRC, and 4 bits of standard GPIO information with a 10-Mbps line rate.

7.3.3 Common Mode Filter Pin (CMF)

The serializer provides access to the center tap of the internal CML termination. A 0.1-µF capacitor must be connected from this pin to GND for additional common-mode filtering of the differential pair (Figure 29). This increases noise rejection capability in high-noise environments.

7.3.4 Video Control Signals

The video control signal bits embedded in the high-speed FPD-Link LVDS are subject to certain limitations relative to the video pixel clock period (PCLK). By default, the DS90UB927Q-Q1 applies a minimum pulse width filter on these signals to help eliminate spurious transitions.

Normal Mode Control Signals (VS, HS, DE) have the following restrictions:
- Horizontal Sync (HS): The video control signal pulse width must be 3 PCLKs or longer when the Control Signal Filter (register bit 0x03[4]) is enabled (default). Disabling the Control Signal Filter removes this restriction (minimum is 1 PCLK). See Table 5. HS can have at most two transitions per 130 PCLKs.
- Vertical Sync (VS): The video control signal pulse is limited to 1 transition per 130 PCLKs. Thus, the minimum pulse width is 130 PCLKs.
- Data Enable Input (DE): The video control signal pulse width must be 3 PCLKs or longer when the Control Signal Filter (register bit 0x03[4]) is enabled (default). Disabling the Control Signal Filter removes this restriction (minimum is 1 PCLK). See Table 5. DE can have at most two transitions per 130 PCLKs.

7.3.5 EMI Reduction Features

7.3.5.1 LVCMOS V_{DDIO} Option

The 1.8-V or 3.3-V LVCMOS inputs and outputs are powered from separate VDDIO supply pins to offer compatibility with external system interface signals. Note: When configuring the V_{DDIO} power supplies, all the single-ended control input pins for device need to scale together with the same operating V_{DDIO} levels. If V_{DDIO} is selected to operate in the 3.0 V to 3.6 V range, V_{DDIO} must be operated within 300 mV of V_{DD33}.

7.3.6 Built-In Self Test (BIST)

An optional At-Speed Built-In Self Test (BIST) feature supports testing of the high speed serial link and the low-speed back channel without external data connections. This is useful in the prototype stage, equipment production, in-system test, and system diagnostics.

Product Folder Links: *DS90UB927Q-Q1*

Feature Description (continued)

7.3.6.1 BIST Configuration and Status

The BIST mode is enabled at the deserializer by pin (BISTEN) or BIST configuration register. The test may select either an external PCLK or the 33-MHz internal Oscillator clock (OSC) frequency. In the absence of PCLK, the user can select the internal OSC frequency at the deserializer through the BISTC pin or BIST configuration register.

When BIST is activated at the deserializer, a BIST enable signal is sent to the serializer through the Back Channel. The serializer outputs a test pattern and drives the link at speed. The deserializer detects the test pattern and monitors it for errors. The deserializer PASS output pin toggles to flag each frame received containing one or more errors. The serializer also tracks errors indicated by the CRC fields in each back channel frame.

The BIST status can be monitored real time on the deserializer PASS pin, with each detected error resulting in a half pixel clock period toggled LOW. After BIST is deactivated, the result of the last test is held on the PASS output until reset (new BIST or Power Down). A high on PASS indicates NO ERRORS were detected. A Low on PASS indicates one or more errors were detected. The duration of the test is controlled by the pulse width applied to the deserializer BISTEN pin. LOCK is valid throughout the entire duration of BIST.

See Figure 14 for the BIST mode flow diagram.

7.3.6.2 Sample BIST Sequence

Step 1: For the DS90UB927Q-Q1 paired with a FPD-Link III Deserializer, BIST Mode is enabled via the BISTEN pin of Deserializer. The desired clock source is selected through the deserializer BISTC pin.

Step 2: The DS90UB927Q-Q1 serializer is awakened through the back channel if it is not already on. An all-zeros pattern is balanced, scrambled, randomized, and sent through the FPD-Link III interface to the deserializer. Once the serializer and the deserializer are in BIST mode and the deserializer acquires Lock, the PASS pin of the deserializer goes high and BIST starts checking the data stream. If an error in the payload (1 to 35) is detected, the PASS pin will switch low for one half of the clock period. During the BIST, the PASS output can be monitored and counted to determine the payload error rate.

Step 3: To Stop the BIST mode, the deserializer BISTEN pin is set Low. The deserializer stops checking the data. The final test result is held on the PASS pin. If the test ran error free, the PASS output will remain HIGH. If there one or more errors were detected, the PASS output will output constant LOW. The PASS output state is held until a new BIST is run, the device is RESET, or the device is powered down. BIST duration is user-controlled and may be of any length.

The link returns to normal operation after the deserializer BISTEN pin is low. Figure 15 shows the waveform diagram of a typical BIST for two cases. Case 1 is error free, and Case 2 shows one with multiple errors. In most cases it is difficult to generate errors due to the robustness of the link (differential data transmission, and so forth), thus they may be introduced by greatly extending the cable length, faulting the interconnect medium, or reducing signal condition enhancements (Rx Equalization).

Figure 14. BIST Mode Flow Diagram

Product Folder Links: *DS90UB927Q-Q1*

Feature Description (continued)

7.3.7 Forward Channel and Back Channel Error Checking

While in BIST mode, the serializer stops sampling the FPD-Link input pins and switches over to an internal all zeroes pattern. The internal all-zeroes pattern goes through scrambler, DC-balancing, and so forth, and is transmitted over the serial link to the deserializer. The deserializer, on locking to the serial stream, compares the recovered serial stream with all-zeroes and records any errors in status registers. Errors are also dynamically reported on the PASS pin of the deserializer.

The back-channel data is checked for CRC errors once the serializer locks onto the back-channel serial stream, as indicated by link detect status (register bit 0x0C[0] - Table 5). CRC errors are recorded in an 8-bit register in the serializer. The register is cleared when the serializer enters BIST mode. As soon as the serializer enters BIST mode, the functional mode CRC register starts recording any back channel CRC errors. The BIST mode CRC error register is active in BIST mode only and keeps a record of the last BIST run until cleared or the serializer enters BIST mode again.
Figure 15. BIST Waveforms

7.3.8 Internal Pattern Generation

The DS90UB927Q-Q1 serializer provides an internal pattern generation feature. It allows basic testing and debugging of an integrated panel. The test patterns are simple and repetitive and allow for a quick visual verification of panel operation. As long as the device is not in power down mode, the test pattern will be displayed even if no input is applied. If no clock is received, the test pattern can be configured to use a programmed oscillator frequency. For detailed information, refer to Application Note AN-2198.

7.3.8.1 Pattern Options

The DS90UB927Q-Q1 serializer pattern generator is capable of generating 17 default patterns for use in basic testing and debugging of panels. Each can be inverted using register bits (Table 5), shown below:

1. White/Black (default/inverted)
2. Black/White
3. Red/Cyan
4. Green/Magenta
5. Blue/Yellow
6. Horizontally Scaled Black to White/White to Black
7. Horizontally Scaled Black to Red/Cyan to White
8. Horizontally Scaled Black to Green/Magenta to White
9. Horizontally Scaled Black to Blue/Yellow to White
10. Vertically Scaled Black to White/White to Black

Product Folder Links: *DS90UB927Q-Q1*

Feature Description (continued)

11. Vertically Scaled Black to Red/Cyan to White

12. Vertically Scaled Black to Green/Magenta to White

13. Vertically Scaled Black to Blue/Yellow to White

14. Custom Color (or its inversion) configured in PGRS

15. Black-White/White-Black Checkerboard (or custom checkerboard color, configured in PGCTL)

16. YCBR/RBCY VCOM pattern, orientation is configurable from PGCTL

17. Color Bars (White, Yellow, Cyan, Green, Magenta, Red, Blue, Black) – Note: not included in the auto-scrolling feature

Additionally, the Pattern Generator incorporates one user-configurable full-screen 24-bit color, which is controlled by the PGRS, PGGS, and PGBS registers. This is pattern #14. One of the pattern options is statically selected in the PGCTL register when Auto-Scrolling is disabled. The PGTSC and PGTSO1-8 registers control the pattern selection and order when Auto-Scrolling is enabled.

7.3.8.2 Color Modes

By default, the Pattern Generator operates in 24-bit color mode, where all bits of the Red, Green, and Blue outputs are enabled. 18-bit color mode can be activated from the configuration registers (Table 5). In 18-bit mode, the 6 most significant bits (bits 7-2) of the Red, Green, and Blue outputs are enabled; the 2 least significant bits will be 0.

7.3.8.3 Video Timing Modes

The Pattern Generator has two video timing modes – external and internal. In external timing mode, the Pattern Generator detects the video frame timing present on the DE and VS inputs. If Vertical Sync signaling is not present on VS, the Pattern Generator determines Vertical Blank by detecting when the number of inactive pixel clocks (DE = 0) exceeds twice the detected active line length. In internal timing mode, the Pattern Generator uses custom video timing as configured in the control registers. The internal timing generation may also be driven by an external clock. By default, external timing mode is enabled. Internal timing or Internal timing with External Clock are enabled by the control registers (Table 5).

7.3.8.4 External Timing

In external timing mode, the Pattern Generator passes the incoming DE, HS, and VS signals unmodified to the video control outputs after a two pixel clock delay. It extracts the active frame dimensions from the incoming signals in order to properly scale the brightness patterns. If the incoming video stream does not use the VS signal, the Pattern Generator determines the Vertical Blank time by detecting a long period of pixel clocks without DE asserted.

7.3.8.5 Pattern Inversion

The Pattern Generator also incorporates a global inversion control, located in the PGCFG register, which causes the output pattern to be bitwise-inverted. For example, the full screen Red pattern becomes full-screen cyan, and the Vertically Scaled Black to Green pattern becomes Vertically Scaled White to Magenta.

7.3.8.6 Auto Scrolling

The Pattern Generator supports an Auto-Scrolling mode, in which the output pattern cycles through a list of enabled pattern types. A sequence of up to 16 patterns may be defined in the registers. The patterns may appear in any order in the sequence and may also appear more than once.

Feature Description (continued)

7.3.9 Remote Auto Power-Down Mode

The DS90UB927Q-Q1 serializer features a Remote Auto Power Down mode. This feature is enabled and disabled through the register bit 0x01[7] (Table 5). When the back channel is not detected, either due to an idle or powered-down deserializer, the serializer enters remote auto power down mode. Power dissipation of the serializer is significantly reduced in this mode. The serializer automatically attempts to resume normal operation upon detection of an active back channel from the deserializer. To complete the wake-up process and reactivate forward channel operation, the remote power-down feature must be disabled by either a local I^{2}C host, or by an auto-ACK I^{2}C transaction from a remote I^{2}C host located at the deserializer. The Remote Auto Power Down Sleep/Wake cycle is shown below in Figure 16:

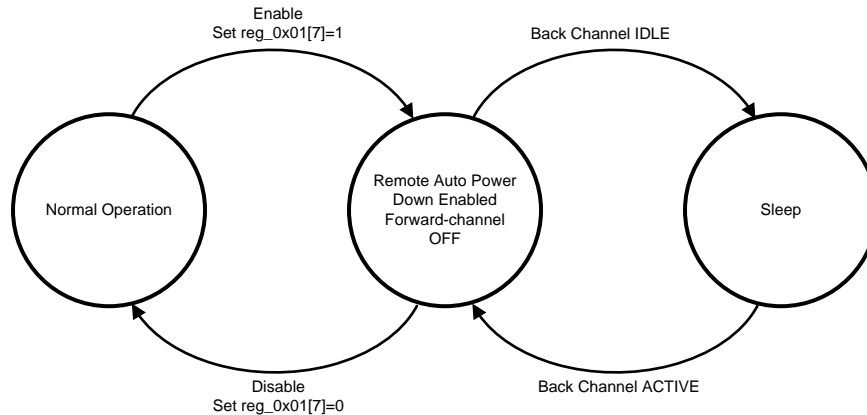

Figure 16. Remote Auto Power Down Sleep/Wake Cycle

To resume normal operation, the Remote Auto Power Down feature must be disabled in the device control register. This may be accomplished from a local I^{2}C controller by writing reg_0x01[7]=0 (Table 5). To disable from a remote I^{2}C controller located at the deserializer, perform the following procedure to complete the wake-up process:

1. Power up remote deserializer (back channel must be active)
2. Enable I^{2}C PASS-THROUGH ALL by setting deserializer register reg_0x05[7]=1
3. Enable I^{2}C AUTO ACK by setting deserializer register reg_0x03[2]=1
4. Disable Remote Auto Power Down by setting serializer register reg_0x01[7]=0
5. Disable I^{2}C AUTO ACK by setting deserializer register reg_0x03[2]=0
6. Disable I^{2}C PASS-THROUGH ALL by setting deserializer register reg_0x05[7]=0

7.3.10 Input RxCLKIN Loss Detect

The serializer can be programmed to enter a low power SLEEP state when the input clock (PCLK) is lost. A clock loss condition is detected when PCLK drops below approximately 1 MHz. When a PCLK is detected again, the serializer will then lock to the incoming RxCLKIN±. Note – when RxCLKIN± is lost, the optional Serial Bus Control Registers values are still retained. See (Table 5) for more information.

7.3.11 Serial Link Fault Detect

The DS90UB927Q-Q1 can detect fault conditions in the FPD-Link III interconnect. If a fault condition occurs, the Link Detect Status is 0 (cable is not detected) on bit 0 of address 0x0C (Table 5). The DS90UB927Q-Q1 will detect any of the following conditions:

1. Cable open
2. "+" to "-" short
3. "+" to GND short
4. "-" to GND short
5. "+" to battery short

Product Folder Links: *DS90UB927Q-Q1*

Feature Description (continued)

6. "-" to battery short
7. Cable is linked incorrectly (DOUT+/DOUT- connections reversed)

Note: The device will detect any of the above conditions, but does not report specifically which one has occurred.

7.3.12 Interrupt Pin (INTB)

1. On the DS90UB927Q-Q1 serializer, set register reg_0xC6[5] = 1 and 0xC6[0] = 1 (Table 5) to configure the interrupt.
2. On the serializer, read from ISR register 0xC7 to arm the interrupt for the first time.
3. When INTB_IN on the deserializer (DS90UB926Q-Q1 or DS90UB928Q-Q1) is set LOW, the INTB pin on the serializer also pulls low, indicating an interrupt condition.
4. The external controller detects INTB = LOW and reads the ISR register (Table 5) to determine the interrupt source. Reading this register also clears and resets the interrupt.

7.3.13 General-Purpose I/O

7.3.13.1 GPIO[3:0]

In normal operation, GPIO[3:0] may be used as general purpose I/Os in either forward channel (inputs) or back channel (outputs) applications. GPIO modes may be configured from the registers (Table 5). GPIO[1:0] are dedicated pins and GPIO[3:2] are shared with I2S_DC and I2S_DD respectively. Note: if the DS90UB927Q-Q1 is paired with a DS90UB926Q-Q1 deserializer, the devices must be configured into 18-bit mode to allow usage of GPIO pins on the DS90UB927 serializer. To enable 18-bit mode, set serializer register reg_0x12[2] = 1. 18-bit mode will be auto-loaded into the deserializer from the serializer. See Table 1 for GPIO enable and configuration.

Table 1. GPIO Enable and Configuration

DESCRIPTION	DEVICE	FORWARD CHANNEL	BACK CHANNEL
GPIO3	DS90UB927Q-Q1	0x0F = 0x03	0x0F = 0x05
	DS90UB926/8Q-Q1	0x1F = 0x05	0x1F = 0x03
GPIO2	DS90UB927Q-Q1	0x0E = 0x30	0x0E = 0x50
	DS90UB926/8Q-Q1	0x1E = 0x50	0x1E = 0x30
GPIO1	DS90UB927Q-Q1	0x0E = 0x03	0x0E = 0x05
	DS90UB926/8Q-Q1	0x1E = 0x05	0x1E = 0x03
GPIO0	DS90UB927Q-Q1	0x0D = 0x03	0x0D = 0x05
	DS90UB926/8Q-Q1	0x1D = 0x05	0x1D = 0x03

The input value present on GPIO[3:0] may also be read from register, or configured to local output mode (Table 5).

7.3.13.2 GPIO[8:5]

GPIO_REG[8:5] are register-only GPIOs and may be programmed as outputs or read as inputs through local register bits only. Where applicable, these bits are shared with I2S pins and will override I2S input if enabled into REG_GPIO mode. See Table 2 for GPIO enable and configuration.

Note: Local GPIO value may be configured and read either through local register access, or remote register access through the Low-Speed Bidirectional Control Channel. Configuration and state of these pins are not transported from serializer to deserializer as is the case for GPIO[3:0].

**Table 2. GPIO_REG and GPIO Local Enable and Configuration**

DESCRIPTION	REGISTER CONFIGURATION	FUNCTION
GPIO_REG8	0x11 = 0x01	Output, L
	0x11 = 0x09	Output, H
	0x11 = 0x03	Input, Read: 0x1D[0]

**Table 2. GPIO_REG and GPIO Local Enable and Configuration (continued)**

DESCRIPTION	REGISTER CONFIGURATION	FUNCTION
GPIO_REG7	0x10 = 0x01	Output, L
	0x10 = 0x09	Output, H
	0x10 = 0x03	Input, Read: 0x1C[7]

	0x0D = 0x03	Input, Read: 0x1C[0]

7.3.14 I^{2}S Audio Interface

The DS90UB927Q-Q1 serializer features six I^{2}S input pins that, when paired with a DS90UB928Q-Q1 deserializer, supports surround sound audio applications. The bit clock (I2S_CLK) supports frequencies between 1 MHz and <PCLK/2 (or <13 MHz). Four I^{2}S data inputs transport two channels of I^{2}S-formatted digital audio each, with each channel delineated by the word select (I2C_WC) input. I^{2}S audio transport is not available in Backwards Compatibility Mode (BKWD = 1).
Figure 17. I^{2}S Connection Diagram
Figure 18. I^{2}S Frame Timing Diagram

When paired with a DS90UB926Q-Q1, the DS90UB927Q-Q1 I^{2}S interface supports a single I^{2}S data input through I2S_DA (24-bit video mode), or two I^{2}S data inputs through I2S_DA and I2S_DB (18-bit video mode).

Table 3 covers several common I^{2}S sample rates:

Product Folder Links: *DS90UB927Q-Q1*

Table 3. Audio Interface Frequencies

Sample Rate (kHz)	I^{2}S Data Word Size (bits)	I2S CLK (MHz)
32	16	1.024
44.1	16	1.411
48	16	1.536
96	16	3.072
192	16	6.144
32	24	1.536
44.1	24	2.117
48	24	2.304
96	24	4.608

32	32	2.048
44.1	32	2.822
48	32	3.072
96	32	6.144
192	32	12.288

7.3.14.1 I^{2}S Transport Modes

By default, audio is packetized and transmitted during video blanking periods in dedicated Data Island Transport frames. Data Island frames may be disabled from control registers if Forward Channel Frame Transport of I^{2}S data is desired. In this mode, only I2S_DA is transmitted to the DS90UB928Q-Q1 deserializer. If connected to a DS90UB926Q-Q1 deserializer, I2S_DA and I2S_DB are transmitted. Surround Sound Mode, which transmits all four I^{2}S data inputs (I2S_D[A..D]), may only be operated in Data Island Transport mode. This mode is only available when connected to a DS90UB928Q-Q1 deserializer.

7.3.14.2 I^{2}S Repeater

I^{2}S audio may be fanned-out and propagated in the repeater application. By default, data is propagated via Data Island Transport on the FPD-Link interface during the video blanking periods. If frame transport is desired, then the I^{2}S pins should be connected from the deserializer to all serializers. Activating surround sound at the top-level deserializer automatically configures downstream DS90UB927Q-Q1 serializers and DS90UB928Q-Q1 deserializers for surround sound transport utilizing Data Island Transport. If 4-channel operation utilizing I2S_DA and I2S_DB only is desired, this mode must be explicitly set in each serializer and deserializer control register throughout the repeater tree (Table 5).

A DS90UB927Q-Q1 serializer configured in repeater mode may also regenerate I^{2}S audio from its I^{2}S input pins in lieu of Data Island frames. See the Repeater Connection Diagram (Figure 23) and the I^{2}C Control Registers (Table 5) for additional details.

7.3.15 Additional Features

Additional pattern generator features can be accessed through the Pattern Generator Indirect Register Map. It consists of the Pattern Generator Indirect Address (PGIA reg_0x66 — Table 5) and the Pattern Generator Indirect Data (PGID reg_0x67 — Table 5). See TI application Note AN-2198.

7.4 Device Functional Modes

7.4.1 Power Down (PDB)

The Serializer has a PDB input pin to ENABLE or POWER DOWN the device. This pin may be controlled by an external device, or through V_{DDIO}, where V_{DDIO} = 3.0 V to 3.6 V or V_{DD33}. To save power, disable the link when the display is not needed (PDB = LOW). Ensure that this pin is not driven HIGH before V_{DD33} and V_{DDIO} have reached final levels. When PDB is driven low, ensure that the pin is driven to 0 V for at least 1.5 ms before releasing or driving high. In the case where PDB is pulled up to V_{DDIO} = 3.0 V to 3.6 V or V_{DD33} directly, a 10-kΩ pullup resistor and a >10-µF capacitor to ground are required (See Figure 29).

Device Functional Modes (continued)

Toggling PDB low will POWER DOWN the device and RESET all control registers to default. During this time, PDB must be held low for a minimum period of time. See *AC Electrical Characteristics* for more information.

7.4.2 Backward Compatible Mode

The DS90UB927Q-Q1 is also backward compatible to DS90UR906Q, DS90UR908Q FPD, and DS90UR916Q FPD-Link II deserializers for PCLK frequencies ranging from 5MHz to 65MHz. It is also backward compatible with the DS90UR910Q for PCLK frequencies ranging from 5 MHz to 75 MHz. The serializer transmits 28-bits of data over a single serial FPD-Link II pair operating at a payload rate of 120 Mbps to 1.8 Gbps, corresponding to a line rate of 140 Mbps to 2.1 Gbps. The Backward Compatibility configuration can be selected through the BKWD pin or programmed through the configuration register (Table 5). The bidirectional control channel, bidirectional GPIOs, I^{2}S, and interrupt (INTB) are not active in this mode. However, local I^{2}C access to the serializer is still available. Note: PCLK frequency range in this mode is 15 MHz to 75 MHz for LFMODE=0 and 5 MHZ to <15 MHz for LFMODE=1.

7.4.3 Low Frequency Optimization (LFMODE)

The LFMODE is set via register (Table 5) or LFMODE Pin. This mode optimizes device operation for lower input data clock ranges supported by the serializer. If LFMODE is Low (LFMODE = 0, default), the RxCLKIN± frequency is between 15 MHz and 85 MHz. If LFMODE is High (LFMODE = 1), the RxCLKIN± frequency is between 5 MHz and <15 MHz. Note: when the device LFMODE is changed, a PDB reset is required. When LFMODE is high (LFMODE=1), the line rate relative to the input data rate is multiplied by four. Thus, for the operating range of 5MHz to <15MHz, the line rate is 700Mbps to <2.1Gbps with an effective data payload of 175Mbps to 525Mbps. Note: for Backwards Compatibility Mode (BKWD=1), the line rate relative to the input data rate remains the same.

7.4.4 FPD-Link Input Frame and Color Bit Mapping Select

The DS90UB927Q-Q1 can be configured to accept 24-bit color (8-bit RGB) with 2 different mapping schemes: LSBs on RxIN[3]±, shown in Figure 19, or MSBs on RxIN[3], shown in Figure 20. Each frame corresponds to a single-pixel clock (PCLK) cycle. The LVDS clock input to RxCLKIN± follows a 4:3 duty cycle scheme, with each 28-bit pixel frame starting with two LVDS bit clock periods high, three low, and ending with two high. The mapping scheme is controlled by MAPSEL pin or by Register (Table 5).

Texas Instruments

## Device Functional Modes (continued)

Figure 20. FPD-Link Mapping: MSBs on RxIN3 (MAPSEL=H)

7.4.5 Repeater

The supported Repeater application provides a mechanism to extend transmission over multiple links to multiple display devices.

7.4.5.1 Repeater Configuration

In the repeater application, this document refers to the DS90UB927Q-Q1 as the Transmitter (TX), and refers to the DS90UB928Q-Q1 as the Receiver (RX). Figure 21 shows the maximum configuration supported for Repeater implementations using the DS90UB925/7Q-Q1 (TX), and DS90UB926/8Q-Q1 (RX). Two levels of Repeaters are supported with a maximum of three Transmitters per Receiver. To ensure parallel video interface compatibility, repeater nodes should feature either the DS90UB926Q-Q1/DS90UB925Q (RX/TX) chipset or the DS90UB927Q-Q1/DS90UB928Q-Q1 (TX/RX) chipset.

Device Functional Modes (continued)
Figure 21. Maximum Repeater Application

In a repeater application, the I^2C interface at each TX and RX may be configured to transparently pass I^2C communications upstream or downstream to any I^2C device within the system. This includes a mechanism for assigning alternate IDs (Slave Aliases) to downstream devices in the case of duplicate addresses.

At each repeater node, the FPD-Link interface fans out to up to three serializer devices, providing video, audio, and control signals and, optionally, packetized audio data (transported during video blanking intervals). Alternatively, the I^2S audio interface may be used to transport digital audio data between receiver and transmitters in place of packetized audio. All audio and video data is transmitted at the output of the receiver and is received by the transmitter.

If video data is output to a local display, White Balancing and Hi-FRC dithering functions should not be used as they will block encrypted I^2S audio.

## Device Functional Modes (continued)
Figure 22. 1:2 Repeater Configuration

7.4.5.2 Repeater Connections

The Repeater requires the following connections between the Receiver and Transmitter Figure 23.

1. Video Data – Connect all FPD-Link data and clock pairs
2. I^{2}C – Connect SCL and SDA signals. Both signals should be pulled up to V_{DD33} or V_{DDIO} = 3.0 V to 3.6 V with 4.7-kΩ resistors.
3. Audio (optional) – Connect I2S_CLK, I2S_WC, and I2S_Dx signals.
4. IDx pin – Each Transmitter and Receiver must have a unique I^{2}C address.
5. REPEAT pin — All Transmitters and Receivers must be set into Repeater Mode.
6. Interrupt pin – Connect DS90UB928Q-Q1 INTB_IN pin to DS90UB927Q-Q1 INTB pin. The signal must be pulled up to V_{DDIO}.

Device Functional Modes (continued)
Figure 23. Repeater Connection Diagram

7.4.5.2.1 Repeater Fan-Out Electrical Requirements

Repeater applications requiring fan-out from one DS90UB928Q-Q1 deserializer to up to three DS90UB927Q-Q1 serializers requires special considerations for routing and termination of the FPD-Link differential traces. Figure 24 details the requirements that must be met for each signal pair:
Product Folder Links: *DS90UB927Q-Q1*

Device Functional Modes (continued)

Figure 24. FPD-Link Fan-Out Electrical Requirements

7.5   Programming

7.5.1   Serial Control Bus

The DS90UB927Q-Q1 may also be configured by the use of an I²C compatible serial control bus. Multiple devices may share the serial control bus (up to 10 device addresses supported). The device address is set via a resistor divider (R1 and R2 — see Figure 25 below) connected to the IDx pin.

Figure 25. Serial Control Bus Connection

The serial control bus consists of two signals, SCL and SDA. SCL is a Serial Bus Clock Input. SDA is the Serial Bus Data Input / Output signal. Both SCL and SDA signals require an external pullup resistor to V_{DD33} or V_{DDIO} = 3.0 V to 3.6 V. For most applications, a 4.7-kΩ pullup resistor to V_{DD33} is recommended. However, the pullup resistor value may be adjusted for capacitive loading and data rate requirements. The signals are either pulled High, or driven Low.

Programming (continued)

The IDx pin configures the control interface to one of 10 possible device addresses. A pullup resistor and a pulldown resistor may be used to set the appropriate voltage ratio between the IDx input pin (V_{R2}) and V_{DD33}, each ratio corresponding to a specific device address. See Table 5 below.

Table 4. Serial Control Bus Addresses for IDx

NO.	Ideal Ratio V_{R2} / V_{DD33}	Ideal V_{R2} (V)	Suggested Resistor R1 kΩ (1% tol)	Suggested Resistor R2 kΩ (1% tol)	Address 7'b	Address 8'b
1	0	0	Open	40.2 or >10	0x0C	0x18
2	0.306	1.011	221	97.6	0x13	0x26
3	0.350	1.154	210	113	0x14	0x28
4	0.393	1.298	196	127	0x15	0x2A

10	0.768	2.535	90.9	301	0x1B	0x36

The Serial Bus protocol is controlled by START, START-Repeated, and STOP phases. A START occurs when SCL transitions Low while SDA is High. A STOP occurs when SDA transitions High while SCL is also HIGH. See Figure 26.

STOP condition

Figure 26. START and STOP Conditions

To communicate with a remote device, the host controller (master) sends the slave address and listens for a response from the slave. This response is referred to as an acknowledge bit (ACK). If a slave on the bus is addressed correctly, it Acknowledges (ACKs) the master by driving the SDA bus low. If the address doesn't match a device's slave address, it Not-acknowledges (NACKs) the master by letting SDA be pulled High. ACKs also occur on the bus when data is being transmitted. When the master is writing data, the slave ACKs after every data byte is successfully received. When the master is reading data, the master ACKs after every data byte is received to let the slave know it wants to receive another data byte. When the master wants to stop reading, it NACKs after the last data byte and creates a stop condition on the bus. All communication on the bus begins with either a Start condition or a Repeated Start condition. All communication on the bus ends with a Stop condition. A READ is shown in Figure 27 and a WRITE is shown in Figure 28.

Product Folder Links: *DS90UB927Q-Q1*

The I²C Master located at the DS90UB927Q-Q1 serializer must support I²C clock stretching. For more information on I²C interface requirements and throughput considerations, refer to TI Application Note SNLA131.

7.6 Register Maps

Table 5. Serial Control Bus Registers

ADD (dec)	ADD (hex)	Register Name	Bit	Type	Default (hex)	Function	Description
0	0x00	I²C Device ID	7:1	RW	IDx	Device ID	7–bit address of Serializer Note: Read-only unless bit 0 is set
			0	RW		ID Setting	I²C ID Setting 0: Device ID is from IDx pin 1: Register I²C Device ID overrides IDx pin
1	0x01	Reset	7	RW	0x00	Remote Auto Power Down	Remote Auto Power Down 0: Do not power down when no Bidirectional Control Channel link is detected (default) 1: Enable power down when no Bidirectional Control Channel link is detected
			6:2				*Reserved*.
			1	RW		Digital RESET1	Reset the entire digital block including registers This bit is self-clearing. 0: Normal operation (default) 1: Reset
			0	RW		Digital RESET0	Reset the entire digital block except registers This bit is self-clearing 0: Normal operation (default) 1: Reset
3	0x03	General Configuration	7	RW	0xD2	Back channel CRC Checker Enable	Back Channel Check Enable 0: Disable 1: Enable (default)
			6				*Reserved*.
			5	RW		I²C Remote Write Auto Acknowledge	Automatically Acknowledge I²C Remote Write When enabled, I²C writes to the Deserializer (or any remote I²C Slave, if I²C PASS ALL is enabled) are immediately acknowledged without waiting for the Deserializer to acknowledge the write. This allows higher throughput on the I²C bus. Note: this mode will prevent any NACK or read/write error indication from a remote device from reaching the I²C master. 0: Disable (default) 1: Enable
			4	RW		Filter Enable	HS, VS, DE two clock filter When enabled, pulses less than two full PCLK cycles on the DE, HS, and VS inputs will be rejected 0: Filtering disable 1: Filtering enable (default)
			3	RW		I²C Pass-through	I²C Pass-Through Mode Read/Write transactions matching any entry in the DeviceAlias registers will be passed through to the remote deserializer I²C interface. 0: Pass-Through Disabled (default) 1: Pass-Through Enabled
3	0x03	General Configuration	2		0xD2		*Reserved*
			1	RW		PCLK Auto	Switch over to internal OSC in the absence of PCLK 0: Disable auto-switch 1: Enable auto-switch (default)
			0	RW		TRFB	*Reserved*

Register Maps (continued)

Table 5. Serial Control Bus Registers (continued)

ADD (dec)	ADD (hex)	Register Name	Bit	Type	Default (hex)	Function	Description
4	0x04	Mode Select	7	RW	0x80	Failsafe State	Input Failsafe State 0: Failsafe to High 1: Failsafe to Low (default)
			6				*Reserved*
			5	RW		CRC Error Reset	Clear back channel CRC Error Counters This bit is NOT self-clearing 0: Normal Operation (default) 1: Clear Counters
			4	RW		DE Gate RGB	DE Gates RGB Data 0: Pass RGB data independent of DE in Backward Compatibility mode and non-HDCP operation (default) 1: Gate RGB data with DE in Backward Compatibility Mode and with non-HDCP deserializers
			3	RW		BKWD ModeOverride	Backward Compatible mode set by BKWD pin or register 0: BC mode is set by BKWD pin (default) 1: BC mode is set by register bit
			2	RW		BKWD	Backward compatibility mode, device to pair with DS90UR906Q, DS90UR908Q, or DS90UR916Q 0: Normal device (default) 1: Compatible with 906/908/916
			1	RW		LFMODE Override	Frequency mode set by LFMODE pin or register 0: Frequency mode is set by LFMODE pin (default) 1: Frequency mode is set by register bit
			0	RW		LFMODE	Frequency mode select 0: High frequency mode (15 MHz ≤ RxCLKIN ≤ 85 MHz) (default) 1: Low frequency mode (5 MHz ≤ RxCLKIN < 15 MHz)
5	0x05	I²C Control	7:5		0x00		*Reserved*
			4:3	RW		SDA Output Delay	SDA output delay Configures output delay on the SDA output. Setting this value will increase output delay in units of 40ns. Nominal output delay values for SCL to SDA are: 00: 240ns (default) 01: 280ns 10: 320ns 11: 360ns
			2	RW		Local Write Disable	Disable Remote Writes to Local Registers Setting this bit to a 1 will prevent remote writes to local device registers from across the control channel. This prevents writes to the Serializer registers from an I²C master attached to the Deserializer. Setting this bit does not affect remote access to I²C slaves at the Serializer. 0: Enable (default) 1: Disable
5	0x05	I²C Control	1	RW	0x00	I²C Bus Timer Speedup	Speed up I²C Bus Watchdog Timer 0: Watchdog Timer expires after approximately 1 s (default) 1: Watchdog Timer expires after approximately 50 μs
			0	RW		I²C Bus timer Disable	Disable I²C Bus Watchdog Timer When the I²C Watchdog Timer may be used to detect when the I²C bus is free or hung up following an invalid termination of a transaction. If SDA is high and no signaling occurs for approximately 1 s, the I²C bus will be assumed to be free. If SDA is low and no signaling occurs, the device will attempt to clear the bus by driving 9 clocks on SCL 0: Enable (default) 1: Disable

Register Maps (continued)

Table 5. Serial Control Bus Registers (continued)

ADD (dec)	ADD (hex)	Register Name	Bit	Type	Default (hex)	Function	Description
6	0x06	DES ID	7:1	RW	0x00	DES Device ID	7-bit Deserializer Device ID Configures the I^{2}C Slave ID of the remote Deserializer. A value of 0 in this field disables I^{2}C access to the remote Deserializer. This field is automatically configured by the Bidirectional Control Channel once RX Lock has been detected. Software may overwrite this value, but should also assert the FREEZE DEVICE ID bit to prevent overwriting by the Bidirectional Control Channel.
			0				*Reserved*
7	0x07	Slave ID 0	7:1	RW	0X00	Slave Device ID 0	7-bit Remote Slave Device ID 0 Configures the physical I^{2}C address of the remote I^{2}C Slave device attached to the remote Deserializer. If an I^{2}C transaction is addressed to the Slave Device Alias ID 0, the transaction will be remapped to this address before passing the transaction across the Bidirectional Control Channel to the Deserializer.
			0				*Reserved*
8	0x08	Slave Alias 0	7:1	RW	0x00	Slave Device Alias ID 0	7-bit Remote Slave Device Alias ID 0 Configures the decoder for detecting transactions designated for an I^{2}C Slave device attached to the remote Deserializer. The transaction will be remapped to the address specified in the Slave ID 0 register. A value of 0 in this field disables access to the remote I^{2}C Slave.
			0				*Reserved*
10	0x0A	CRC Errors	7:0	R	0x00	CRC Error LSB	Number of Back Channel CRC errors – 8 least significant bits. Cleared by 0x04[5]
11	0x0B		7:0	R	0x00	CRC Error MSB	Number of Back Channel CRC errors – 8 most significant bits. Cleared by 0x04[5]
12	0x0C	General Status	7:4		0x00		*Reserved*
			3	R		BIST CRC Error	Back Channel CRC error during BIST communication with Deserializer. This bit is cleared upon loss of link, restart of BIST, or assertion of CRC ERROR RESET in register 0x04. 0: No CRC errors detected during BIST (default) 1: CRC Errors detected during BIST
			2	R		PCLK Detect	Pixel Clock Status 0: Valid PCLK not detected (default) 1: Valid PCLK detected
			1	R		DES Error	CRC error during BIST communication with Deserializer. This bit is cleared upon loss of link or assertion of 0x04[5] 0: No CRC errors detected (default) 1: CRC errors detected
			0	R		LINK Detect	LINK Detect Status 0: Cable link not detected (default) 1: Cable link detected

8 Application and Implementation

> **NOTE**
>
> Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The DS90UB927Q-Q1, in conjunction with the DS90UB928Q-Q1 or DS90UB926Q-Q1, is intended for interface between a host (graphics processor) and a display, supporting 24-bit color depth (RGB888) and high definition (720p) digital video format. It can receive an 8-bit RGB stream with a pixel clock rate up to 85 MHz together with three control bits (VS, HS and DE) and four I^2S audio streams.

8.2 Typical Application

Figure 29 shows a typical application of the DS90UB927Q-Q1 serializer for an 85-MHz 24-bit Color Display Application. The 5 LVDS input pairs require external 100Ω terminations. The CML outputs must have an external 0.1-µF AC coupling capacitor on the high speed serial lines. The serializer has internal CML termination on its high speed outputs.

Bypass capacitors should be placed near the power supply pins. At a minimum, four (4) 4.7-µF capacitors should be used for local device bypassing. Ferrite beads are placed on the two sets of supply pins (VDD33 and VDDIO) for effective noise suppression. The interface to the graphics source is LVDS. The VDDIO pins may be connected to 3.3 V or 1.8 V. A capacitor and resistor are placed on the PDB pin to delay the enabling of the device until power is stable.

Typical Application (continued)
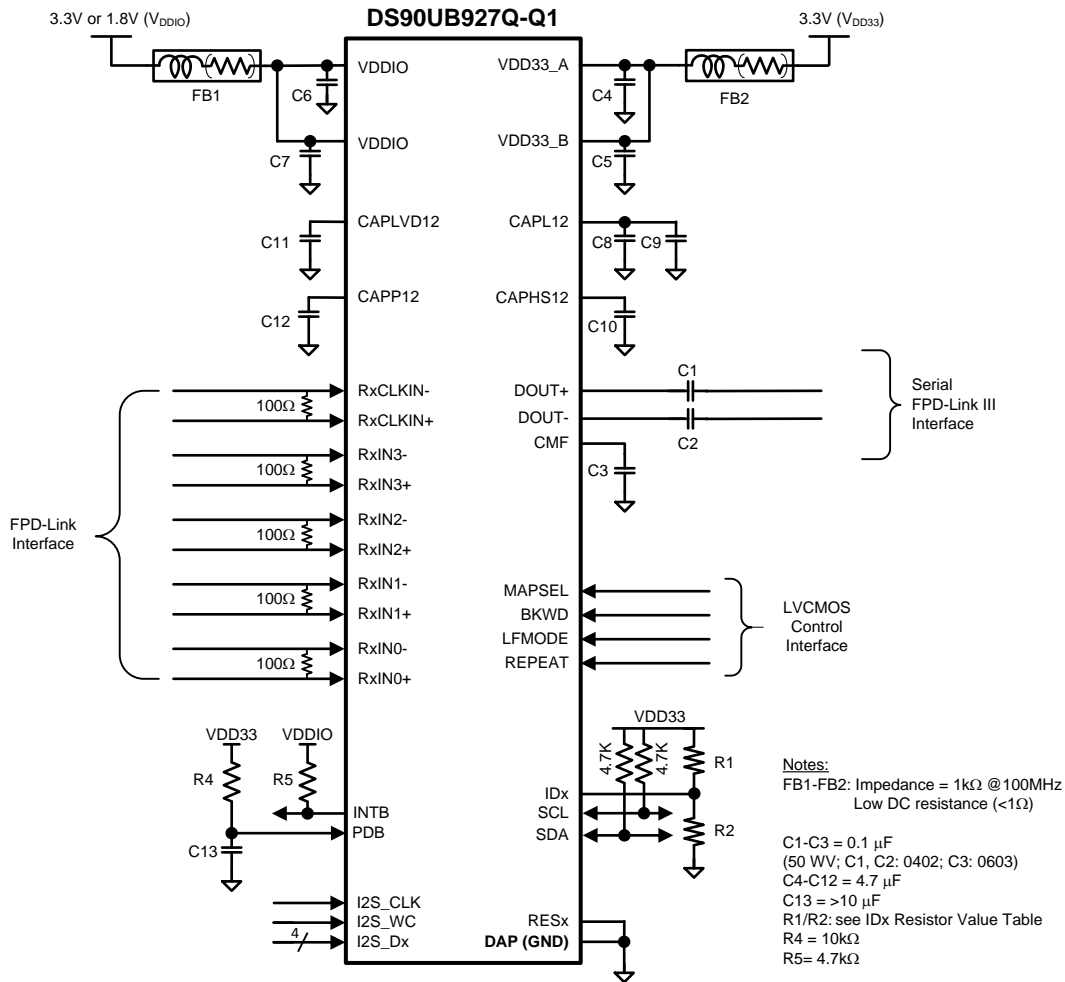

Figure 29. Color Display Typical Connection Diagram

8.2.1 Design Requirements

For the typical design application, use the following as input parameters.

Table 6. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
VDDIO	1.8 V or 3.3 V
VDD33	3.3 V
AC Coupling Capacitor for DOUT±	100 nF
PCLK Frequency	85 MHz

8.2.2 Detailed Design Procedure

Figure 29 shows a typical application of the DS90UB927Q-Q1 serializer for an 85-MHz 24-bit Color Display Application. The CML outputs must have an external 0.1-µF AC coupling capacitor on the high speed serial lines. Bypass capacitors are placed near the power supply pins. At a minimum, six 4.7-µF capacitors and two additional 1-µF capacitors should be used for local device bypassing. Ferrite beads are placed on the two VDDs (VDD33 and VDDIO) for effective noise suppression. An RC delay is placed on the PDB signal to delay the enabling of the device until power is stable.

8.3 System Examples
Figure 32. Color Display Application Diagram

System Examples (continued)
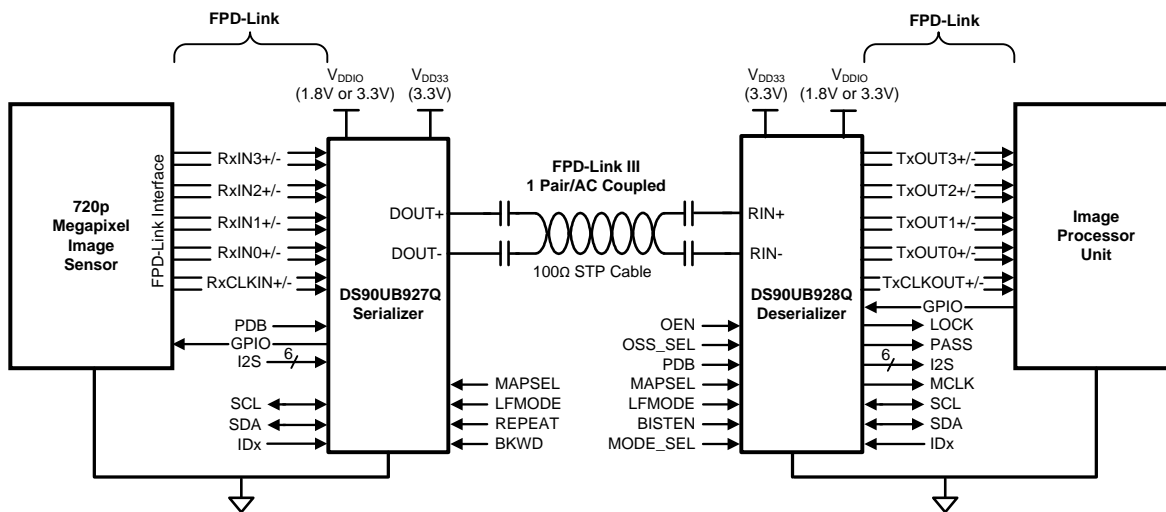

Figure 33. Megapixel Camera Application Diagram

9 Power Supply Recommendations

This section describes the power-up requirements and PDB pin. The power supply ramp (V_{DD33} and V_{DDIO}) should be faster than 1.5 ms with a monotonic rise. A large capacitor on the PDB pin is needed to ensure PDB arrives after all the supply pins have settled to the recommended operating voltage. When PDB pin is pulled up to V_{DD33}, a 10-kΩ pullup and a >10-µF capacitor to GND are required to delay the PDB input signal rise. All inputs must not be driven until both V_{DD33} and V_{DDIO} has reached steady state. Pins VDD33_A and VDD33_B should both be externally connected, bypassed, and driven to the same potential (they are not internally connected).

10 Layout

10.1 Layout Guidelines

Circuit board layout and stack-up for the LVDS serializer and deserializer devices should be designed to provide low-noise power to the device. Good layout practice will also separate high frequency or high-level inputs and outputs to minimize unwanted stray noise, feedback and interference. Power system performance may be greatly improved by using thin dielectrics (2 to 4 mil) for power / ground sandwiches. This arrangement utilizes the plane capacitance for the PCB power system and has low-inductance, which has proven effectiveness especially at high frequencies, and makes the value and placement of external bypass capacitors less critical. External bypass capacitors should include both RF ceramic and tantalum electrolytic types. RF capacitors may use values in the range of 0.01 µF to 10 µF. Tantalum capacitors may be in the 2.2 µF to 10 µF range. The voltage rating of the tantalum capacitors should be at least 5X the power supply voltage being used.

MLCC surface mount capacitors are recommended due to their smaller parasitic properties. When using multiple capacitors per supply pin, locate the smaller value closer to the pin. A large bulk capacitor is recommended at the point of power entry. This is typically in the 50 µF to 100 µF range and will smooth low frequency switching noise. It is recommended to connect power and ground pins directly to the power and ground planes with bypass capacitors connected to the plane with via on both ends of the capacitor. Connecting power or ground pins to an external bypass capacitor will increase the inductance of the path. A small body size X7R chip capacitor, such as 0603 or 0805, is recommended for external bypass. A small body sized capacitor has less inductance. The user must pay attention to the resonance frequency of these external bypass capacitors, usually in the range of 20 MHz to 30 MHz. To provide effective bypassing, multiple capacitors are often used to achieve low impedance between the supply rails over the frequency of interest. At high frequency, it is also a common practice to use two vias from power and ground pins to the planes, reducing the impedance at high frequency.

Some devices provide separate power and ground pins for different portions of the circuit. This is done to isolate switching noise effects between different sections of the circuit. Separate planes on the PCB are typically not required. Pin Description tables typically provide guidance on which circuit blocks are connected to which power pin pairs. In some cases, an external filter may be used to provide clean power to sensitive circuits such as PLLs. For DS90UB927Q-Q1, only one common ground plane is required to connect all device related ground pins.

Use at least a four layer board with a power and ground plane. Locate LVCMOS signals away from the LVDS lines to prevent coupling from the LVCMOS lines to the LVDS lines. Closely coupled differential lines of 100Ω are typically recommended for LVDS interconnect. The closely coupled lines help to ensure that coupled noise will appear as common mode and thus is rejected by the receivers. The tightly coupled lines will also radiate less.

At least 9 thermal vias are necessary from the device center DAP to the ground plane. They connect the device ground to the PCB ground plane, as well as conduct heat from the exposed pad of the package to the PCB ground plane. More information on the WQFN style package, including PCB design and manufacturing requirements, is provided in TI Application Note: *AN-1187 Leadless Leadframe Package (LLP)* (SNOA401).

Layout Guidelines (continued)

10.1.1 CML Interconnect Guidelines

See SNLA008 and SNLA035 for full details.

- Use 100-Ω coupled differential pairs
- Use the S/2S/3S rule in spacings
  - – S = space between the pair
  - – 2S = space between pairs
  - – 3S = space to LVCMOS signal
- Minimize the number of Vias
- Use differential connectors when operating above 500 Mbps line speed
- Maintain balance of the traces
- Minimize skew within the pair
- Terminate as close to the TX outputs and RX inputs as possible.

Additional general guidance can be found in the *LVDS Owner's Manual* - available at: SNLA187

10.2 Layout Example

Figure 34 PCB layout example is derived from the layout design of the DS90UB927Q-Q1 Evaluation Board. The graphic and layout description are used to determine both proper routing and proper solder techniques when designing the Serializer board.

[1] The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

[2] Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

[3] MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

[4] There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

[5] Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

[6] Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
